[Received on 1 April 2014]

#### Abstract

This work proposes and analyzes a new Local Projection Stabilized finite element method (LPS for short) for the non-linear incompressible Navier-Stokes equations. Stokes problems defined element-wisely drive the construction of the stabilized terms which make the present method stable for continuos velocity and (dis)continuos pressure finite element pairs $\mathbb{P}_{1} \times \mathbb{P}_{l}, l=0,1$, in two- and three -dimensions. Existence and uniqueness of a discrete solution and a non-singular branch of solutions are proved under standard assumptions. Also, we establish that the LPS method achieves optimal error estimates in the natural norms. Numerics assess the theoretical results and validate the LPS method in the three-dimensional case.

Keywords: Navier-Stokes equations, stabilized finite element, low-order method

## 1. Introduction

Stabilized finite element methods have been used extensively to solve the incompressible Navier-Stokes equations since the seminal paper Brooks \& Hughes (1982), followed by the works Franca \& Frey (1992) and Lube \& Tobiska (1990). Introduced as a strategy to circumvent (unstable) mixed finite elements, these methods make the equal order and the simplest elements (i.e., the space pair $\mathbb{P}_{1} \times \mathbb{P}_{0}$ ) inf-sup stable (see Ern \& Guermond (2004) and Girault \& Raviart (1986) for details) by adding extra variational terms to the classical Galerkin method. Originally, stabilized methods add residual local terms to the Galerkin formulation preserving consistency. Classical examples are the SUPG, GLS and SDFEM methods Franca et al. (1992); Baiocchi et al. (1993); Tobiska \& Verfürth (1996), just to cite a few among the vast literature on the subject.

[^0]Recently, a family of non-residual stabilized finite element method have become popular as they add fewer (symmetric) terms to the formulation when compared to their residual counterpart. Such schemes, originally proposed in Becker \& Braack (2001) for the Stokes problem (see also Codina (2008), Burman et al. (2006), Braack \& Lube (2009), Ganesan \& Tobiska (2010) for alternative versions) and known as Local Projection Stabilized (LPS) methods, may be seen as a "term-by-term" stabilized method for which the extra terms are based on the projection onto a polynomial space defined with respect to a coarser triangulation through a de-refinement of the original mesh. Hence, in general, such methods demand a special data structure to be implemented. Meanwhile, the so-called Residual Local Projection (RELP) stabilized methods Barrenechea \& Valentin (2010a) reincorporate the residual idea into the construction of stabilized methods, but now merged with the fundamental idea behind the LPS methodology. This is achieved through interpolation operators (fluctuation operators) defined on finite dimensional spaces generated by the solution of local problems (see Barrenechea \& Valentin (2010b) for this idea applied to the Oseen equation). From this point of view, the RELP method resembles to the Residual-Free-Bubble (RFB) approach Brezzi et al. (1998) which introduced local driven problems to build stabilized terms without priori knowledge on their structures. In Araya et al. (2012), the original RELP method given in Barrenechea \& Valentin (2010b) was extended to the incompressible Navier-Stokes equations, and proved to be well-posed and optimal convergent.

In this work, we propose and analyze a new LPS method for the incompressible Navier-Stokes equations built up on the RELP method given in Araya et al. (2012). This leads to a much simpler method (in terms of number of stabilized terms) than the original RELP method. Here, we focus on the piecewiselinear continuos space for the velocity variable, and the piecewise constant or linear (dis)continuos spaces for the pressure, as those choices are the most common in practice. Also, these choices make closed formula available to approximating the second level problems without undermining theoretical results. As a result, the proposed stabilized method may be implemented easily in standard finite element codes.

In regard to theoretical results, this work establishes well-posedness and an optimal convergence result in the natural norms for the new LPS method within the framework presented in Araya et al. (2012) and Tobiska \& Verfürth (1996). Specifically, the stability and convergence analysis rely on the fixed point theory proposed in Brezzi et al. (1980); Girault \& Raviart (1986). This point of view has also been adopted in Tobiska \& Verfürth (1996) to analyze the stabilized method originally proposed in Franca \& Frey (1992) (see also Codina \& Blasco (2000) for a related result). Due to the particular structure of the method, the proof requests the construction of a new stabilized finite element method for the Stokes equation, which is also analyzed. It is worth mentioning that a detailed analysis for the three-dimensional case is performed under standard conditions. This differs from Araya et al. (2012). Also interesting, we show that the underlined lack of consistency of the LPS method (which is absent in Araya et al. (2012)) remains controlled, i.e., it stays at order of the leading errors. The stated theoretical results are assessed through a large variety of three-dimensional computational benchmarks.

The paper is outlined as follows: In Section 2 we present some notations, definitions and technical results which will be used throughout this work. The LPS method is introduced in Section 3 as well as existence and uniqueness results. Section 4 is devoted to the a priori error analysis and numerical validations are presented in Section 5. Conclusions are given in Section 6.

## 2. Notations and preliminary results

Let $\Omega \subseteq \mathbb{R}^{d},(d=2$ or 3 ) be a polygonal (polyhedral) open domain. The steady incompressible NavierStokes equations consists of finding the velocity and the pressure $(\boldsymbol{u}, \tilde{p})$ such that

$$
\begin{gather*}
-v \Delta \boldsymbol{u}+(\nabla \boldsymbol{u}) \boldsymbol{u}+\nabla \tilde{p}=\tilde{\boldsymbol{f}}, \quad \nabla \cdot \boldsymbol{u}=0 \quad \text { in } \Omega,  \tag{2.1}\\
\boldsymbol{u}=\mathbf{0} \quad \text { on } \partial \Omega
\end{gather*}
$$

where $v \in \mathbb{R}^{+}$is the fluid viscosity and $\tilde{\boldsymbol{f}} \in L^{2}(\Omega)^{d}$. Adopting standard notations for Sobolev spaces, the weak form associated to (2.1) reads: Find $(\boldsymbol{u}, \tilde{p}) \in \boldsymbol{H} \times Q:=H_{0}^{1}(\Omega)^{d} \times L_{0}^{2}(\Omega)$ such that:

$$
\boldsymbol{v}(\nabla \boldsymbol{u}, \nabla \boldsymbol{v})+((\nabla \boldsymbol{u}) \boldsymbol{u}, \boldsymbol{v})-(\tilde{p}, \nabla \cdot \boldsymbol{v})+(q, \nabla \cdot \boldsymbol{u})=(\tilde{\boldsymbol{f}}, \boldsymbol{v}) \quad \text { for all }(\boldsymbol{v}, q) \in \boldsymbol{H} \times Q,
$$

where $(\cdot, \cdot)$ stands for the $L^{2}(\Omega)$-inner product (or $L^{2}(\Omega)^{d}$ ).
Let $D$ be an open subset of $\Omega$, we denote by $\|\cdot\|_{m, D}$ the norm in $H^{m}(D)$, and by $\|\cdot\|_{m, q, D}$ the norm in $W^{m, q}(D)$ with $m \geqslant 0$ and $1 \leqslant q \leqslant \infty$. We denote, as usual, $H^{-1}(\Omega)$ the dual space of $H_{0}^{1}(\Omega)$ equipped with the dual norm $\|\cdot\|_{-1, \Omega}$ and the duality product $\langle\cdot, \cdot\rangle$, and $H^{0}(\Omega)=L^{2}(\Omega)$ and $W^{0, q}(\Omega)=L^{q}(\Omega)$. Also, we equip the space $\boldsymbol{H} \times Q$ with the norm $\||\cdot \||$ given as follows

$$
\|(\boldsymbol{v}, q)\|:=\left\{|\boldsymbol{v}|_{1, \Omega}^{2}+\|q\|_{0, \Omega}^{2}\right\}^{1 / 2}
$$

and the dual space of $\boldsymbol{H} \times Q$ (denoted by $(\boldsymbol{H} \times Q)^{\prime}$ ) with the norm $\|\cdot\|_{(\boldsymbol{H} \times Q)^{\prime}}$ given by

$$
\|(\boldsymbol{v}, q)\|_{(\boldsymbol{H} \times Q)^{\prime}}:=\sup _{\|(\boldsymbol{w}, r)\|}\{\langle\boldsymbol{v}, \boldsymbol{w}\rangle+(q, r)\} .
$$

Let $\left\{\mathscr{T}_{h}\right\}_{h>0}$ be a family of regular triangulations of $\bar{\Omega}$, built up of triangles $(d=2)$, or tetrahedra $(d=3) K$ with boundary $\partial K$ and characteristic length $h_{K}:=\operatorname{diam}(K)$. For each triangulation $\mathscr{T}_{h}$, we define $h:=\max \left\{h_{K}: K \in \mathscr{T}_{h}\right\}$, and denote by $\mathscr{E}_{h}$ the set of internal edges (faces) $F$ of the partition $\mathscr{T}_{h}$, and $h_{F}:=\operatorname{diam}(F)$. We denote by $\boldsymbol{n}$ the outward normal vector on $\partial K$; $\llbracket v \rrbracket$ stands for the jump of $v$ across $F$. In addition, for $K \in \mathscr{T}_{h}$ and $F \in \mathscr{E}_{h}$, we define the neighborhoods $\omega_{K}:=\left\{K^{\prime} \in \mathscr{T}_{h}: K^{\prime} \cap K \neq \emptyset\right\}$ and $\omega_{F}:=\left\{K \in \mathscr{T}_{h}: F \cap K \neq \emptyset\right\}$. Finally, we denote by $\Pi_{S}$, with $S \subset \mathbb{R}^{d}$, the orthogonal projection onto the constant space $\mathbb{P}_{0}(S)$, i.e., $\Pi_{S}(q):=\frac{(q, 1)_{S}}{|S|}$, and by $H^{m}\left(\mathscr{T}_{h}\right), m \geqslant 1$ the space of functions in $L^{2}(\Omega)$ whose restriction to each $K \in \mathscr{T}_{h}$ belongs to $H^{m}(K)$.

We associate to the partition $\mathscr{T}_{h}$ the discrete space for the velocity $\boldsymbol{H}_{h}$, composed of vector-valued piecewise linear continuous functions with zero trace on $\partial \Omega$. To approximate the pressure, we adopt the discrete space $Q_{h}$ defined as the space of piecewise polynomial functions of degree $l,(l=0,1)$ with zero mean value on $\Omega$. In the case $l=1$, the space $Q_{h}$ may represent continuous or discontinuous functions.

Next, we equip the dual of the discrete spaces with the following norm

$$
\|(\boldsymbol{v}, q)\|_{\left(\boldsymbol{H}_{h} \times Q_{h}\right)^{\prime}}:=\sup _{\left\|\left(\boldsymbol{w}_{h}, r_{h}\right)\right\| \leqslant 1}\left\{\left\langle\boldsymbol{v}, \boldsymbol{w}_{h}\right\rangle+\left(q, r_{h}\right)\right\} .
$$

Also, the differential of a mapping $F: \boldsymbol{H} \times Q \rightarrow \boldsymbol{H} \times Q$ with respect to $(\boldsymbol{u}, q)$ is denoted by $D_{\boldsymbol{u}, p} F(\boldsymbol{v}, q) \in$ $\mathscr{L}(\boldsymbol{H} \times Q)$, where $\mathscr{L}(\boldsymbol{H} \times Q)$ stands for the space of linear mappings acting on elements of $\boldsymbol{H} \times Q$ with values in $\boldsymbol{H} \times Q$ and equipped with the usual norm $\|\cdot\|_{\mathscr{L}(\boldsymbol{H} \times Q)}$.

Now, we recall some classical results which will be needed in the forthcoming analysis sections.

Lemma 2.1 There exist positive constants $\alpha$ and $\beta$, depending only on $\Omega$, such that for all $\boldsymbol{v}, \boldsymbol{w} \in \boldsymbol{H}$ and $q \in Q$, it holds

$$
\begin{align*}
\sup _{\boldsymbol{v} \in \boldsymbol{H} \backslash\{\boldsymbol{0}\}} \frac{(q, \nabla \cdot \boldsymbol{v})}{|\boldsymbol{v}|_{1, \Omega}} & \geqslant \beta\|q\|_{0, \Omega}  \tag{2.2}\\
((\nabla \boldsymbol{u}) \boldsymbol{w}, \boldsymbol{v}) & \leqslant \boldsymbol{\alpha}|\boldsymbol{u}|_{1, \Omega}|\boldsymbol{w}|_{1, \Omega}|\boldsymbol{v}|_{1, \Omega} \tag{2.3}
\end{align*}
$$

Moreover, for all $\boldsymbol{u}, \boldsymbol{v}, \boldsymbol{w} \in \boldsymbol{H}$, it holds

$$
\begin{equation*}
((\nabla \boldsymbol{v}) \boldsymbol{w}, \boldsymbol{v})=-\frac{1}{2}(\nabla \cdot \boldsymbol{w}, \boldsymbol{v} \cdot \boldsymbol{v}) \tag{2.4}
\end{equation*}
$$

Proof. See Girault \& Raviart (1986) and Temam (1995).
The following inverse inequality estimates hold for the functions in $\boldsymbol{H}_{h}$ and $Q_{h}$.
Lemma 2.2 There exists a positive constant $C$, independent of $h$, such for all $\boldsymbol{v}_{h} \in \boldsymbol{H}_{h}$ and all $q_{h} \in Q_{h}$, we have

$$
\begin{align*}
\left\|\boldsymbol{v}_{h}\right\|_{l, p, K} & \leqslant C h_{K}^{m-l+d\left(\frac{1}{p}-\frac{1}{q}\right)}\left\|\boldsymbol{v}_{h}\right\|_{m, q, K}  \tag{2.5}\\
\left\|\llbracket q_{h} \rrbracket\right\|_{0, F} & \leqslant C h_{F}^{-1 / 2}\left\|q_{h}\right\|_{0, \omega_{F}} \tag{2.6}
\end{align*}
$$

where $0 \leqslant m \leqslant l$ and $1 \leqslant p, q \leqslant \infty$.
Proof. See Lemma 1.138 in Ern \& Guermond (2004).
Some properties of the orthogonal projection $\Pi_{K}$, onto the constant space, are summarized in the following result.
Lemma 2.3 There exists a constant $C>0$, independent of $h$, such that

$$
\begin{align*}
\left\|v-\Pi_{K} v\right\|_{0, K} & \leqslant C h_{K}|v|_{1, K} \quad \forall v \in H^{1}(K)  \tag{2.7}\\
\left\|\Pi_{K} v\right\|_{0, K} & \leqslant\|v\|_{0, K} \quad \forall v \in L^{2}(K) \tag{2.8}
\end{align*}
$$

Proof. See Proposition 1.135 in Ern \& Guermond (2004).
Let $\mathscr{I}_{h}: \boldsymbol{H} \cap H^{2}(\Omega)^{d} \longrightarrow \boldsymbol{H}_{h}$ be the Lagrange interpolation operator for the velocity, and let $\mathscr{J}_{h}$ : $Q \longrightarrow Q_{h}$ be either a modified Clément operator for the continuous pressures case $(l=1)$ or the orthogonal projection onto the space $Q_{h}$ in the discontinuous pressure case $(l=0,1)$. These interpolation operators satisfy the following inequalities (see Clément (1975); Ern \& Guermond (2004))

$$
\begin{array}{rll}
\left|\boldsymbol{v}-\mathscr{I}_{h} \boldsymbol{v}\right|_{m, K} & \leqslant C h_{K}^{2-m}|\boldsymbol{v}|_{2, K} & \forall \boldsymbol{v} \in H^{2}(K)^{d}, \\
\left|\mathscr{I}_{h} \boldsymbol{v}\right|_{1, K} & \leqslant C\|\boldsymbol{v}\|_{2, K} & \forall \boldsymbol{v} \in H^{2}(K)^{d}, \\
\left\|\boldsymbol{v}-\mathscr{I}_{h} \boldsymbol{v}\right\|_{1, r, K} & \leqslant C\|\boldsymbol{v}\|_{1, r, K} & \forall \boldsymbol{v} \in W^{1, r}(K)^{d}, \forall r \in(2, \infty], \\
\left\|\boldsymbol{v}-\mathscr{I}_{h} \boldsymbol{v}\right\|_{\infty, K} & \leqslant C\|\boldsymbol{v}\|_{\infty, K} & \forall \boldsymbol{v} \in \mathscr{C}^{0}(K)^{d}, \\
\left|q-\mathscr{J}_{h} q\right|_{i, K} & \leqslant C h_{K}^{j-i}|q|_{j, \omega_{K}} & \forall q \in H^{j}\left(\omega_{K}\right), \\
\left\|q-\mathscr{J}_{h} q\right\|_{0, F} & \leqslant C h_{F}^{j-1 / 2}\|q\|_{j, \omega_{F}} & \forall q \in H^{j}\left(\omega_{F}\right), \tag{2.14}
\end{array}
$$

where $0 \leqslant m \leqslant 2$, and $0 \leqslant i \leqslant 1,1 \leqslant j \leqslant l+1$ and $C$ is a positive constant independent of $h$.

### 2.1 The scaled model and the Stokes case

The analysis of the well-posedness and the convergence aspects of the present LPS method will rely on the Brezzi, Rappaz and Raviart theory proposed in Girault \& Raviart (1986) within the concept of branches of non-singular solutions. Thereby, we assume that there exist neighborhoods in which the solution of the Navier-Stokes equations is unique (i.e., the solutions are isolated). It turns out that this effectively occurs in many practical problems. Moreover, the solution depends continuously with respect to the viscosity. As a result, and since the viscosity belongs to a compact set, each solution of the Navier-Stokes equations generates an isolated branch. Now, it is more convenient to consider the scaled form of (2.1). To this end, we set $\tilde{p}=v p, \tilde{f}=v f$, and $\lambda=v^{-1}$, and rewrite (2.1) as follows

$$
\begin{gather*}
-\Delta \boldsymbol{u}_{\lambda}+\lambda\left(\nabla \boldsymbol{u}_{\lambda}\right) \boldsymbol{u}_{\lambda}+\nabla p_{\lambda}=\boldsymbol{f}, \quad \nabla \cdot \boldsymbol{u}_{\lambda}=0 \quad \text { in } \Omega  \tag{2.15}\\
\boldsymbol{u}_{\lambda}=\mathbf{0} \quad \text { on } \partial \Omega
\end{gather*}
$$

The standard weak formulation of problem (2.15) is given by: Find $\left(\boldsymbol{u}_{\lambda}, p_{\lambda}\right) \in \boldsymbol{H} \times Q$ such that

$$
\begin{equation*}
\left(\nabla \boldsymbol{u}_{\lambda}, \nabla \boldsymbol{v}\right)+\lambda\left(\left(\nabla \boldsymbol{u}_{\lambda}\right) \boldsymbol{u}_{\lambda}, \boldsymbol{v}\right)-\left(p_{\lambda}, \nabla \cdot \boldsymbol{v}\right)+\left(q, \nabla \cdot \boldsymbol{u}_{\lambda}\right)=(\boldsymbol{f}, \boldsymbol{v}) \quad \forall(\boldsymbol{v}, q) \in \boldsymbol{H} \times Q . \tag{2.16}
\end{equation*}
$$

We assume in this work that problem (2.16) admits at least one solution, which is unique provided $\lambda$ is sufficiently small. Next, observe that (2.16) can be written in a operator form as follows

$$
\begin{equation*}
F\left(\lambda, u_{\lambda}, p_{\lambda}\right):=\left(\boldsymbol{u}_{\lambda}, p_{\lambda}\right)+T G\left(\lambda, u_{\lambda}, p_{\lambda}\right)=\mathbf{0} \tag{2.17}
\end{equation*}
$$

where $G\left(\boldsymbol{\lambda}, \boldsymbol{u}_{\lambda}, p_{\lambda}\right) \in \boldsymbol{H}^{\prime} \times Q$ is given by

$$
\left\langle G\left(\lambda, \boldsymbol{u}_{\lambda}, p_{\lambda}\right),(\boldsymbol{v}, q)\right\rangle:=\lambda\left(\left(\nabla \boldsymbol{u}_{\lambda}\right) \boldsymbol{u}_{\lambda}, \boldsymbol{v}\right)-(\boldsymbol{f}, \boldsymbol{v}) \quad \forall(\boldsymbol{v}, q) \in \boldsymbol{H} \times Q,
$$

and $T: \boldsymbol{H}^{\prime} \times Q \longrightarrow \boldsymbol{H} \times Q$ denotes the Stokes operator, which associates for each $(\boldsymbol{w}, r) \in \boldsymbol{H}^{\prime} \times Q$, the unique solution $(\boldsymbol{u}, p) \in \boldsymbol{H} \times Q$ of

$$
(\nabla \boldsymbol{u}, \nabla \boldsymbol{v})-(p, \nabla \cdot \boldsymbol{v})+(q, \nabla \cdot \boldsymbol{u})=\langle\boldsymbol{w}, \boldsymbol{v}\rangle+(r, q),
$$

for all $(\boldsymbol{v}, q) \in \boldsymbol{H} \times Q$.
Using such a viewpoint, we introduce $T_{h}: \boldsymbol{H}^{\prime} \times Q \longrightarrow \boldsymbol{H}_{h} \times Q_{h}$ the discrete counterpart of the Stokes operator, which associates to each $(\boldsymbol{w}, r) \in \boldsymbol{H}^{\prime} \times Q$, the unique solution of the following stabilized method: Find $\left(\boldsymbol{u}_{h}, p_{h}\right) \in \boldsymbol{H}_{h} \times Q_{h}$ such that

$$
\boldsymbol{B}\left(\left(\boldsymbol{u}_{h}, p_{h}\right),\left(\boldsymbol{v}_{h}, q_{h}\right)\right)=\left\langle\boldsymbol{w}, \boldsymbol{v}_{h}\right\rangle+\left(r, q_{h}\right) \quad \forall\left(\boldsymbol{v}_{h}, q_{h}\right) \in \boldsymbol{H}_{h} \times Q_{h}
$$

where the bilinear form $\boldsymbol{B}(\cdot, \cdot)$ is given by

$$
\begin{aligned}
\boldsymbol{B}\left(\left(\boldsymbol{u}_{h}, p_{h}\right),\left(\boldsymbol{v}_{h}, q_{h}\right)\right):= & \left(\nabla \boldsymbol{u}_{h}, \nabla \boldsymbol{v}_{h}\right)-\left(p_{h}, \nabla \cdot \boldsymbol{v}_{h}\right)+\left(q_{h}, \nabla \cdot \boldsymbol{u}_{h}\right) \\
& +\sum_{K \in \mathscr{T}_{h}}\left[\left(\chi_{h}\left(p_{h}\right), \chi_{h}\left(q_{h}\right)\right)_{K}+\left(\lambda \chi_{h}\left(\boldsymbol{x} \nabla \cdot \boldsymbol{u}_{h}\right), \lambda \chi_{h}\left(\boldsymbol{x} \nabla \cdot \boldsymbol{v}_{h}\right)\right)_{K}\right] \\
& +\sum_{F \in \mathscr{E}_{h}} \frac{h_{F}}{12}\left(\llbracket p_{h} \rrbracket, \llbracket q_{h} \rrbracket\right)_{F} .
\end{aligned}
$$

Here $\chi_{h}:=\mathrm{I}-\Pi_{K}$ is the so-called fluctuation operator.

REMARK 2.1 The discrete Stokes operator $T_{h}$ induces a new stabilized finite element method which, as far as we are aware, is new in the literature. Thereby, we introduce the following mesh-dependent norm

$$
\left\|\left(\boldsymbol{v}_{h}, q_{h}\right)\right\|_{h}^{2}:=\left|\boldsymbol{v}_{h}\right|_{1, \Omega}^{2}+\sum_{K \in \mathscr{T}_{h}}\left\|\chi_{h}\left(q_{h}\right)\right\|_{0, K}^{2}+\left\|\lambda \chi_{h}\left(\boldsymbol{x} \nabla \cdot \boldsymbol{v}_{h}\right)\right\|_{0, K}^{2}+\sum_{F \in \mathscr{E}_{h}} \frac{h_{F}}{12}\| \| q_{h} \rrbracket \|_{0, F}^{2} \quad \forall\left(\boldsymbol{v}_{h}, q_{h}\right) \in \boldsymbol{H}_{h} \times Q_{h},
$$

and it is easy to see from the definition of $\boldsymbol{B}$ that it holds

$$
\boldsymbol{B}\left(\left(\boldsymbol{v}_{h}, q_{h}\right),\left(\boldsymbol{v}_{h}, q_{h}\right)\right)=\left\|\left(\boldsymbol{v}_{h}, q_{h}\right)\right\|_{h}^{2} \quad \forall\left(\boldsymbol{v}_{h}, q_{h}\right) \in \boldsymbol{H}_{h} \times Q_{h}
$$

and, then, the operator $T_{h}$ is well-defined.
Observe that we can easily adapt the analysis presented in Appendix A of Araya et al. (2012) to prove the following estimates.
Lemma 2.4 There exist constants $C, C^{\prime}>0$, independent of $h$ and $\lambda$, such that it holds

$$
\begin{aligned}
\left\|\left(T-T_{h}\right)(\boldsymbol{w}, 0)\right\| & \leqslant C h(1+\lambda h)^{2}\|\boldsymbol{w}\|_{0, \Omega} \\
\left\|T_{h}(\boldsymbol{w}, q)\right\| & \leqslant C^{\prime}(1+\lambda h)^{2}\|(\boldsymbol{w}, q)\|_{\left(\boldsymbol{H}_{h} \times Q_{h}\right)^{\prime}}
\end{aligned} \quad \forall(\boldsymbol{w}, q) \in(\boldsymbol{H} \times Q)^{\prime} .
$$

## 3. The Local Projection Stabilized Method

### 3.1 The method

We introduce a local Stokes problem as a first step toward the full definition of the method. To this end, we use Araya et al. (2012) to set the following problem: Given $\boldsymbol{v} \in L^{2}(K)^{d}$, let $\left(\boldsymbol{u}_{e}^{K}(\boldsymbol{v}), p_{e}^{K}(\boldsymbol{v})\right) \in$ $H_{0}^{1}(K)^{d} \times L_{0}^{2}(K)$ be the solution of the following (local) problem

$$
-\boldsymbol{v} \Delta \boldsymbol{u}_{e}^{K}(\boldsymbol{v})+\nabla p_{e}^{K}(\boldsymbol{v})=\boldsymbol{v}, \quad \nabla \cdot \boldsymbol{u}_{e}^{K}(\boldsymbol{v})=0 \quad \text { in } K, ~\left(\begin{array}{l}
K  \tag{3.1}\\
\\
\boldsymbol{u}_{e}^{K}(\boldsymbol{v})=\mathbf{0} \text { on } \partial K .
\end{array}\right.
$$

The following result, proved in Lemma 3.2 of Barrenechea \& Valentin (2010a), shows that the operator $p_{e}^{K}$ is stable in the $L^{2}$ norm.
Lemma 3.1 Let $\boldsymbol{v} \in L^{2}(K)^{d}$ and let $p_{e}^{K}(\boldsymbol{v})$ the solution of problem (3.1). Then, there exists $C>0$, independent of $h_{K}$, such that

$$
\begin{equation*}
\left\|p_{e}^{K}(\boldsymbol{v})\right\|_{0, K} \leqslant C h_{K}\|\boldsymbol{v}\|_{0, K} \tag{3.2}
\end{equation*}
$$

Now we are ready to present the LPS method for equation (2.1), which reads: Find $\left(\boldsymbol{u}_{h}, \tilde{p}_{h}\right) \in$ $\boldsymbol{H}_{h} \times Q_{h}$ such that

$$
\begin{align*}
& \boldsymbol{v}\left(\nabla \boldsymbol{u}_{h}, \nabla \boldsymbol{v}_{h}\right)+\left(\left(\nabla \boldsymbol{u}_{h}\right) \boldsymbol{u}_{h}, \boldsymbol{v}_{h}\right)-\left(\tilde{p}_{h}, \nabla \cdot \boldsymbol{v}_{h}\right)+\left(\tilde{q}_{h}, \nabla \cdot \boldsymbol{u}_{h}\right) \\
& +\sum_{K \in \mathscr{T}_{h}} \frac{\alpha_{K}}{v}\left[\left(\chi_{h}\left(\tilde{p}_{h}\right), \chi_{h}\left(\tilde{q}_{h}\right)\right)_{K}+\left(p_{e}^{K}\left(\left(\nabla \boldsymbol{u}_{h}\right) \boldsymbol{u}_{h}\right), p_{e}^{K}\left(\left(\nabla \boldsymbol{v}_{h}\right) \boldsymbol{u}_{h}\right)\right)_{K}\right] \\
& +\sum_{K \in \mathscr{T}_{h}} \frac{\gamma_{K}}{v}\left(\chi_{h}\left(\boldsymbol{x} \nabla \cdot \boldsymbol{u}_{h}\right), \chi_{h}\left(\boldsymbol{x} \nabla \cdot \boldsymbol{v}_{h}\right)\right)_{K}+\sum_{F \in \mathscr{E}_{h}} \tau_{F}\left(\llbracket \tilde{p}_{h} \rrbracket, \llbracket \tilde{q}_{h} \rrbracket\right)_{F}=\left(\tilde{\boldsymbol{f}}, \boldsymbol{v}_{h}\right), \tag{3.3}
\end{align*}
$$

for all $\left(\boldsymbol{v}_{h}, \tilde{q}_{h}\right) \in \boldsymbol{H}_{h} \times Q_{h}$. The stabilization parameters are given by

$$
\alpha_{K}:=\frac{1}{\max \left\{1, P e_{K}\right\}} \quad \text { and } \quad \gamma_{K}:=\frac{1}{\max \left\{1, \frac{P e_{K}}{24}\right\}}
$$

with

$$
P e_{K}:=\frac{\left|\boldsymbol{u}_{h}\right|_{K} h_{K}}{18 v} \quad \text { with } \quad\left|\boldsymbol{u}_{h}\right|_{K}:=\frac{\left\|\boldsymbol{u}_{h}\right\|_{0, K}}{|K|^{\frac{1}{2}}}
$$

and

$$
\tau_{F}:=\left\{\begin{array}{l}
\frac{h_{F}}{12 v}, \quad \text { if }\left|\boldsymbol{u}_{h}\right|_{F}=0, \\
\frac{1}{2\left|\boldsymbol{u}_{h}\right|_{F}}-\frac{1}{\left|\boldsymbol{u}_{h}\right|_{F}\left(1-\exp \left(P e_{F}\right)\right)}\left(1+\frac{1}{P e_{F}}\left(1-\exp \left(P e_{F}\right)\right)\right), \quad \text { otherwise. }
\end{array}\right.
$$

Here

$$
P e_{F}:=\frac{\left|\boldsymbol{u}_{h}\right|_{F} h_{F}}{v} \quad \text { with } \quad\left|\boldsymbol{u}_{h}\right|_{F}:=\frac{\left\|\boldsymbol{u}_{h}\right\|_{0, F}}{h_{F}^{1 / 2}} .
$$

The numerical analysis of (3.3) will assume that the scaled version of the Navier-Stokes equations (2.15) holds. As such, and for sake of clarity, we adapt the LPS method (3.3) accordingly, which now takes the following form: Find $\left(\boldsymbol{u}_{h, \lambda}, p_{h, \lambda}\right) \in \boldsymbol{H}_{h} \times Q_{h}$ such that for all $\left(\boldsymbol{v}_{h}, q_{h}\right) \in \boldsymbol{H}_{h} \times Q_{h}$,

$$
\begin{align*}
& \left(\nabla \boldsymbol{u}_{h, \lambda}, \nabla \boldsymbol{v}_{h}\right)+\lambda\left(\left(\nabla \boldsymbol{u}_{h, \lambda}\right) \boldsymbol{u}_{h, \lambda}, \boldsymbol{v}_{h}\right)-\left(p_{h, \lambda}, \nabla \cdot \boldsymbol{v}_{h}\right)+\left(q_{h}, \nabla \cdot \boldsymbol{u}_{h, \lambda}\right) \\
& +\sum_{K \in \mathscr{T}_{h}} \alpha_{K}\left[\left(\chi_{h}\left(p_{h, \lambda}\right), \chi_{h}\left(q_{h}\right)\right)_{K}+\left(p_{e}^{K}\left(\lambda\left(\nabla \boldsymbol{u}_{h, \lambda}\right) \boldsymbol{u}_{h, \lambda}\right), p_{e}^{K}\left(\lambda\left(\nabla \boldsymbol{v}_{h}\right) \boldsymbol{u}_{h, \lambda}\right)\right)_{K}\right] \\
& +\sum_{K \in \mathscr{T} h} \gamma_{K}\left(\lambda \chi_{h}\left(\boldsymbol{x} \nabla \cdot \boldsymbol{u}_{h, \lambda}\right), \lambda \chi_{h}\left(\boldsymbol{x} \nabla \cdot \boldsymbol{v}_{h}\right)\right)_{K}+\sum_{F \in \mathscr{E}_{h}} \tilde{\tau}_{F}\left(\llbracket p_{h, \lambda} \rrbracket, \llbracket q_{h} \rrbracket\right)_{F}=\left(\boldsymbol{f}, \boldsymbol{v}_{h}\right), \tag{3.4}
\end{align*}
$$

where $\tilde{\tau}_{F}:=\frac{\tau_{F}}{\lambda}$.
REMARK 3.1 The design of LPS method (3.3) is strongly inspired by the RELP method Araya et al. (2012), the former excluding the mixed pressure-velocity variational terms which are responsible for making the RELP method consistent. Another difference resides in the definition of the stabilized boundary terms which are now simpler (only pressure jumps are involved) than the ones proposed in the RELP version. Such simplifications may be seen as an example of the "minimal stabilization" concept developed in Brezzi \& Fortin (2001), now used in the context of the incompressible Navier-Stokes equations. Indeed, we prove in the next sections that the stabilized terms are free to act differently and independently on the pressure and velocity variables without weakening the theoretical results obtained for original method (see Araya et al. (2012) for details).

### 3.2 Existence and uniqueness

Following the ideas presented in Tobiska \& Verfürth (1996) and Araya et al. (2012), we start defining the operator $\mathscr{P}: \boldsymbol{H}_{h} \longrightarrow Q_{h}$ by

$$
\begin{equation*}
\sum_{K \in \mathscr{T}_{h}} \alpha_{K}\left(\chi_{h}\left(\mathscr{P}\left(\boldsymbol{u}_{h}\right)\right), \chi_{h}\left(q_{h}\right)\right)_{K}+\sum_{F \in \mathscr{E}_{h}} \tilde{\tau}_{F}\left(\llbracket \mathscr{P}\left(\boldsymbol{u}_{h}\right) \rrbracket, \llbracket q_{h} \rrbracket\right)_{F}=-\left(q_{h}, \nabla \cdot \boldsymbol{u}_{h}\right) \tag{3.5}
\end{equation*}
$$

for all $q_{h} \in Q_{h}$. Note that the operator $\mathscr{P}$ is well defined due to Lax-Milgram's Lemma with the norm

$$
\left\|q_{h}\right\|_{*}:=\left\{\sum_{K \in \mathscr{T}_{h}} \alpha_{K}\left\|\chi_{h}\left(q_{h}\right)\right\|_{0, K}^{2}+\sum_{F \in \mathscr{E}_{h}} \tilde{\tau}_{F}\left\|\llbracket q_{h} \rrbracket\right\|_{0, F}^{2}\right\}^{1 / 2}
$$

Also, we define the mapping $\mathscr{N}: \boldsymbol{H}_{h} \longrightarrow \boldsymbol{H}_{h}$ by

$$
\begin{aligned}
\left(\mathscr{N}\left(\boldsymbol{u}_{h}\right), \boldsymbol{v}_{h}\right):= & \left(\nabla \boldsymbol{u}_{h}, \nabla \boldsymbol{v}_{h}\right)+\left(\lambda\left(\nabla \boldsymbol{u}_{h}\right) \boldsymbol{u}_{h}, \boldsymbol{v}_{h}\right)-\left(\mathscr{P}\left(\boldsymbol{u}_{h}\right), \nabla \cdot \boldsymbol{v}_{h}\right)-\left(\boldsymbol{f}, \boldsymbol{v}_{h}\right) \\
& +\sum_{K \in \mathscr{T}_{h}} \alpha_{K}\left(\lambda p_{e}^{K}\left(\left(\nabla \boldsymbol{u}_{h}\right) \boldsymbol{u}_{h}\right), \lambda p_{e}^{K}\left(\left(\nabla \boldsymbol{v}_{h}\right) \boldsymbol{u}_{h}\right)\right)_{K} \\
& +\sum_{K \in \mathscr{T}_{h}} \gamma_{K}\left(\lambda \chi_{h}\left(\boldsymbol{x} \nabla \cdot \boldsymbol{u}_{h}\right), \lambda \chi_{h}\left(\boldsymbol{x} \nabla \cdot \boldsymbol{v}_{h}\right)\right)_{K}
\end{aligned}
$$

for all $\boldsymbol{u}_{h}, \boldsymbol{v}_{h} \in \boldsymbol{H}_{h}$. The following result provides a characterization of the solution of (3.4) in terms of the mappings $\mathscr{P}$ and $\mathscr{N}$.
Lemma 3.2 The pair $\left(\boldsymbol{u}_{h, \lambda}, p_{h, \lambda}\right) \in \boldsymbol{H}_{h} \times Q_{h}$ is a solution of problem (3.4) if and only if $\mathscr{N}\left(\boldsymbol{u}_{h, \lambda}\right)=\mathbf{0}$ and $p_{h, \lambda}=\mathscr{P}\left(\boldsymbol{u}_{h, \lambda}\right)$.
Proof. For details see Lemma 3.5 in Araya et al. (2012).
Next, we establish a sufficient condition assuring the existence of a discrete solution for (3.4).
THEOREM 3.1 There is a positive constant $\tilde{C}$, independent of $\lambda$ and $h$, such that if

$$
\begin{equation*}
\lambda h^{1 / 2}\|\boldsymbol{f}\|_{-1, \Omega} \leqslant \tilde{C} \tag{3.6}
\end{equation*}
$$

then problem (3.4) admits at least one solution $\left(\boldsymbol{u}_{h, \lambda}, p_{h, \lambda}\right) \in \boldsymbol{H}_{h} \times Q_{h}$.
Proof. Let $\boldsymbol{u}_{h} \in \boldsymbol{H}_{h}$, with $\left|\boldsymbol{u}_{h}\right|_{1, \Omega}=R$, with $R$ a positive constant to be fixed latter. In the sequel, we will use the following notation

$$
\begin{gathered}
x:=\left\{\sum_{K \in \mathscr{T}_{h}} \alpha_{K}\left\|p_{e}^{K}\left(\lambda\left(\nabla \boldsymbol{u}_{h}\right) \boldsymbol{u}_{h}\right)\right\|_{0, K}^{2}\right\}^{1 / 2}, \quad y:=\left\{\sum_{F \in \mathscr{E}_{h}} \tilde{\tau}_{F}\| \| \mathscr{P}\left(\boldsymbol{u}_{h}\right) \rrbracket \|_{0, F}^{2}\right\}^{1 / 2} \\
z:=\|\boldsymbol{f}\|_{-1, \Omega}, \quad w:=\left\{\sum_{K \in \mathscr{T}_{h}} \gamma_{K}\left\|\lambda \chi_{h}\left(\boldsymbol{x} \nabla \cdot \boldsymbol{u}_{h}\right)\right\|_{0, K}^{2}\right\}^{1 / 2}, \quad t:=\left\{\sum_{K \in \mathscr{T}_{h}} \alpha_{K}\left\|\chi_{h}\left(\mathscr{P}\left(\boldsymbol{u}_{h}\right)\right)\right\|_{0, K}^{2}\right\}^{1 / 2}
\end{gathered}
$$

Taking $q_{h}=\mathscr{P}\left(\boldsymbol{u}_{h}\right)$ in (3.5) we get

$$
-\left(\mathscr{P}\left(\boldsymbol{u}_{h}\right), \nabla \cdot \boldsymbol{u}_{h}\right)=\sum_{K \in \mathscr{T}_{h}} \alpha_{K}\left\|\chi_{h}\left(\mathscr{P}\left(\boldsymbol{u}_{h}\right)\right)\right\|_{0, K}^{2}+\sum_{F \in \mathscr{E}_{h}} \tilde{\tau}_{F}\left\|\llbracket \mathscr{P}\left(\boldsymbol{u}_{h}\right) \rrbracket\right\|_{0, F}^{2}
$$

Using the above identity, Cauchy-Schwarz's inequality and (2.4), it holds

$$
\begin{align*}
& \left(\mathscr{N}\left(\boldsymbol{u}_{h}\right), \boldsymbol{u}_{h}\right)=\left|\boldsymbol{u}_{h}\right|_{1, \Omega}^{2}+\lambda\left(\left(\nabla \boldsymbol{u}_{h}\right) \boldsymbol{u}_{h}, \boldsymbol{u}_{h}\right)-\left(\boldsymbol{f}, \boldsymbol{u}_{h}\right)+\sum_{K \in \mathscr{T}_{h}} \alpha_{K}\left\|\chi_{h}\left(\mathscr{P}\left(\boldsymbol{u}_{h}\right)\right)\right\|_{0, K}^{2} \\
& +\sum_{F \in \mathscr{E}_{h}} \tilde{\tau}_{F}\left\|\llbracket \mathscr{P}\left(\boldsymbol{u}_{h}\right)\right\|\left\|_{0, F}^{2}+\sum_{K \in \mathscr{T}_{h}} \alpha_{K}\right\| \lambda p_{e}^{K}\left(\left(\nabla \boldsymbol{u}_{h}\right) \boldsymbol{u}_{h}\right)\left\|_{0, K}^{2}+\sum_{K \in \mathscr{T}_{h}} \gamma_{K}\right\| \lambda \chi_{h}\left(\boldsymbol{x} \nabla \cdot \boldsymbol{u}_{h}\right) \|_{0, K}^{2} \\
& \geqslant R^{2}+\lambda\left(\left(\nabla \boldsymbol{u}_{h}\right) \boldsymbol{u}_{h}, \boldsymbol{u}_{h}\right)-\|\boldsymbol{f}\|_{-1, \Omega}\left|\boldsymbol{u}_{h}\right|_{1, \Omega}+t^{2}+y^{2}+x^{2}+w^{2} \\
& \geqslant \frac{1}{2} R^{2}+x^{2}+y^{2}+t^{2}+w^{2}-\frac{1}{2} z^{2}-\frac{\lambda}{2}\left(\nabla \cdot \boldsymbol{u}_{h}, \boldsymbol{u}_{h} \cdot \boldsymbol{u}_{h}\right) . \tag{3.7}
\end{align*}
$$

Now, using Cauchy-Schwarz's inequality, Lemma 3.1, (3.5) with $q_{h}=\mathscr{J}_{h}\left(\boldsymbol{u}_{h} \cdot \boldsymbol{u}_{h}\right)$, the fact that $\alpha_{K} \leqslant 1$, (2.13) and the mesh regularity, we get

$$
\begin{aligned}
& \left|\left(\nabla \cdot \boldsymbol{u}_{h}, \boldsymbol{u}_{h} \cdot \boldsymbol{u}_{h}\right)\right| \leqslant\left|\left(\nabla \cdot \boldsymbol{u}_{h}, \boldsymbol{u}_{h} \cdot \boldsymbol{u}_{h}-\mathscr{J}_{h}\left(\boldsymbol{u}_{h} \cdot \boldsymbol{u}_{h}\right)\right)\right|+\left|\left(\nabla \cdot \boldsymbol{u}_{h}, \mathscr{J}_{h}\left(\boldsymbol{u}_{h} \cdot \boldsymbol{u}_{h}\right)\right)\right| \\
\leqslant & \sqrt{d}\left|\boldsymbol{u}_{h}\right|_{1, \Omega}\left\|\boldsymbol{u}_{h} \cdot \boldsymbol{u}_{h}-\mathscr{J}_{h}\left(\boldsymbol{u}_{h} \cdot \boldsymbol{u}_{h}\right)\right\|_{0, \Omega}+\left|\sum_{K \in \mathscr{T}_{h}} \alpha_{K}\left(\chi_{h}\left(\mathscr{P}\left(\boldsymbol{u}_{h}\right)\right), \chi_{h}\left(\mathscr{J}_{h}\left(\boldsymbol{u}_{h} \cdot \boldsymbol{u}_{h}\right)\right)\right)_{K}\right| \\
& +\left|\sum_{F \in \mathscr{E}_{h}} \tilde{\tau}_{F}\left\|\llbracket \mathscr{P}\left(\boldsymbol{u}_{h}\right) \rrbracket\right\|_{0, F}\left\|\llbracket \mathscr{J}_{h}\left(\boldsymbol{u}_{h} \cdot \boldsymbol{u}_{h}\right) \rrbracket\right\|_{0, F}\right| \\
\leqslant & C R\left\{\sum_{K \in \mathscr{T}_{h}} h_{K}^{2}\left|\boldsymbol{u}_{h} \cdot \boldsymbol{u}_{h}\right|_{1, K}^{2}\right\}^{1 / 2}+\sum_{K \in \mathscr{T}_{h}} \alpha_{K}\left\|\chi_{h}\left(\mathscr{P}\left(\boldsymbol{u}_{h}\right)\right)\right\|_{0, K}\left\|\chi_{h}\left(\mathscr{J}_{h}\left(\boldsymbol{u}_{h} \cdot \boldsymbol{u}_{h}\right)\right)\right\|_{0, K} \\
& +\sum_{F \in \mathscr{E}_{h}} \tilde{\tau}_{F}\left\|\llbracket \mathscr{P}\left(\boldsymbol{u}_{h}\right) \rrbracket\right\|_{0, F}\left\|\llbracket \mathscr{J}_{h}\left(\boldsymbol{u}_{h} \cdot \boldsymbol{u}_{h}\right) \rrbracket\right\|_{0, F} \\
\leqslant & C R\left\{\sum_{K \in \mathscr{T}_{h}} h_{K}^{2}\left|\boldsymbol{u}_{h} \cdot \boldsymbol{u}_{h}\right|_{1, K}^{2}\right\}^{1 / 2}+C \sum_{K \in \mathscr{T}_{h}} \alpha_{K}\left\|\chi_{h}\left(\mathscr{P}\left(\boldsymbol{u}_{h}\right)\right)\right\|_{0, K} h_{K}\left|\mathscr{J}_{h}\left(\boldsymbol{u}_{h} \cdot \boldsymbol{u}_{h}\right)\right|_{1, K} \\
& +\sum_{F \in \mathscr{E}_{h}}^{\tilde{\tau}_{F}\left\|\llbracket \mathscr{P}\left(\boldsymbol{u}_{h}\right) \rrbracket\right\|_{0, F}\left\|\llbracket \mathscr{J}_{h}\left(\boldsymbol{u}_{h} \cdot \boldsymbol{u}_{h}\right) \rrbracket\right\|_{0, F}} \\
\leqslant & C R\left\{\sum_{K \in \mathscr{T}_{h}} h_{K}^{2}\left|\boldsymbol{u}_{h} \cdot \boldsymbol{u}_{h}\right|_{1, K}^{2}\right\}^{1 / 2}+C t\left\{\sum_{K \in \mathscr{T}_{h}} \alpha_{K} h_{K}^{2}\left|\boldsymbol{u}_{h} \cdot \boldsymbol{u}_{h}\right|_{1, \omega_{K}}^{2}\right\}^{1 / 2}+y\left\{\sum_{F \in \mathscr{E}_{h}} \tilde{\tau}_{F}\left\|\llbracket \mathscr{J}_{h}\left(\boldsymbol{u}_{h} \cdot \boldsymbol{u}_{h}\right) \rrbracket\right\|_{0, F}^{2}\right\}^{1 / 2} \\
\leqslant & C\{R+t+y\}\left\{\sum_{K \in \mathscr{T}_{h}} h_{K}^{2}\left|\boldsymbol{u}_{h} \cdot \boldsymbol{u}_{h}\right|_{1, K}^{2}+\sum_{F \in \mathscr{E}_{h}} \tilde{\tau}_{F}\left\|\llbracket \mathscr{J}_{h}\left(\boldsymbol{u}_{h} \cdot \boldsymbol{u}_{h}\right)-\boldsymbol{u}_{h} \cdot \boldsymbol{u}_{h} \rrbracket\right\|_{0, F}^{2}\right\}^{1 / 2} \cdot
\end{aligned}
$$

Using that $\tilde{\tau}_{F} \leqslant C h_{F}$ (see Lemma 2 in Barrenechea \& Valentin (2010b)), (2.6), (2.13) and the mesh regularity, we have

$$
\begin{aligned}
\sum_{F \in \mathscr{E}_{h}} \tilde{\tau}_{F}\left\|\llbracket \mathscr{J}_{h}\left(\boldsymbol{u}_{h} \cdot \boldsymbol{u}_{h}\right)-\boldsymbol{u}_{h} \cdot \boldsymbol{u}_{h} \rrbracket\right\|_{0, F}^{2} & \leqslant C \sum_{K \in \mathscr{T}_{h}}\left\|\mathscr{J}_{h}\left(\boldsymbol{u}_{h} \cdot \boldsymbol{u}_{h}\right)-\boldsymbol{u}_{h} \cdot \boldsymbol{u}_{h}\right\|_{0, K}^{2} \\
& \leqslant C \sum_{K \in \mathscr{T}_{h}} h_{K}^{2}\left|\boldsymbol{u}_{h} \cdot \boldsymbol{u}_{h}\right|_{1, K}^{2}
\end{aligned}
$$

thus we arrive at

$$
\begin{equation*}
\left|\left(\nabla \cdot \boldsymbol{u}_{h}, \boldsymbol{u}_{h} \cdot \boldsymbol{u}_{h}\right)\right| \leqslant C\{R+t+y\}\left\{\sum_{K \in \mathscr{T}_{h}} h_{K}^{2}\left|\boldsymbol{u}_{h} \cdot \boldsymbol{u}_{h}\right|_{1, K}^{2}\right\}^{1 / 2} \tag{3.8}
\end{equation*}
$$

Also, applying the local inverse inequality (2.5) with $l=m=0, p=\infty$ and $1 \leqslant q \leqslant \infty$, we obtain that $\left\|v_{h}\right\|_{\infty, K} \leqslant C h_{K}^{-\frac{d}{q}}\left\|v_{h}\right\|_{0, q, K}$. Next, using the Sobolev embedding $H^{1}(\Omega) \hookrightarrow L^{q}(\Omega)$, which is valid for all $2 \leqslant q<\infty$ if $d=2$ and for $2 \leqslant q \leqslant 6$, if $d=3$, we get

$$
\begin{aligned}
\left|\boldsymbol{u}_{h} \cdot \boldsymbol{u}_{h}\right|_{1, K} & =\left\|\nabla\left(\boldsymbol{u}_{h} \cdot \boldsymbol{u}_{h}\right)\right\|_{0, K}=2\left\|\nabla\left(\boldsymbol{u}_{h}\right) \boldsymbol{u}_{h}\right\|_{0, K} \leqslant C\left|\boldsymbol{u}_{h}\right|_{1, K}\left\|\boldsymbol{u}_{h}\right\|_{\infty, K} \\
& \leqslant C h_{K}^{-\frac{d}{q}}\left|\boldsymbol{u}_{h}\right|_{1, K}\left\|\boldsymbol{u}_{h}\right\|_{0, q, K} \leqslant C h_{K}^{-\frac{d}{q}}\left|\boldsymbol{u}_{h}\right|_{1, K}\left\|\boldsymbol{u}_{h}\right\|_{0, q, \Omega} \leqslant C h_{K}^{-\frac{d}{q}}\left|\boldsymbol{u}_{h}\right|_{1, K}\left|\boldsymbol{u}_{h}\right|_{1, \Omega} .
\end{aligned}
$$

Now, taking $q=4$, if $d=2$, or $q=6$, if $d=3$, we get

$$
\left|\boldsymbol{u}_{h} \cdot \boldsymbol{u}_{h}\right|_{1, K} \leqslant C h_{K}^{-\frac{1}{2}}\left|\boldsymbol{u}_{h}\right|_{1, K}\left|\boldsymbol{u}_{h}\right|_{1, \Omega}
$$

and then from (3.7) and (3.8), we arrive at

$$
\begin{aligned}
& \left(\mathscr{N}\left(\boldsymbol{u}_{h}\right), \boldsymbol{u}_{h}\right) \geqslant \frac{1}{2} R^{2}+x^{2}+w^{2}+y^{2}+t^{2}-\frac{1}{2} z^{2}-\frac{\lambda}{2}\left(\nabla \cdot \boldsymbol{u}_{h}, \boldsymbol{u}_{h} \cdot \boldsymbol{u}_{h}\right) \\
\geqslant & \frac{1}{2} R^{2}+x^{2}+w^{2}+y^{2}+t^{2}-\frac{1}{2} z^{2}-C \frac{\lambda}{2}\{R+t+y\}\left\{\sum_{K \in \mathscr{T}} h_{K}\left|\boldsymbol{u}_{h}\right|_{1, K}^{2}\right\}^{1 / 2}\left|\boldsymbol{u}_{h}\right|_{1, \Omega} \\
\geqslant & \frac{1}{2} R^{2}+x^{2}+w^{2}+y^{2}+t^{2}-\frac{1}{2} z^{2}-C h^{\frac{1}{2}} \lambda\{R+t+y\} R^{2} \\
\geqslant & \frac{1}{2} R^{2}+x^{2}+w^{2}+y^{2}+t^{2}-\frac{1}{2} z^{2}-C h^{\frac{1}{2}} \lambda R^{3}-C h^{\frac{1}{2}} \lambda\{t+y\} R^{2} \\
\geqslant & \frac{1}{2} R^{2}+x^{2}+w^{2}+y^{2}+t^{2}-\frac{1}{2} z^{2}-C h^{\frac{1}{2}} \lambda R^{3}-\frac{1}{2} t^{2}-\frac{1}{2} y^{2}-\frac{3}{2} C^{2} h \lambda^{2} R^{4} \\
\geqslant & \frac{1}{2} R^{2}+x^{2}+\frac{1}{2} t^{2}+w^{2}+\frac{1}{2} y^{2}-z^{2}-C h^{\frac{1}{2}} \lambda R^{3}-\frac{3}{2} C^{2} h \lambda^{2} R^{4} .
\end{aligned}
$$

We define $R:=\frac{1}{6 C \lambda h^{1 / 2}}$ and $\tilde{C}:=\frac{1}{12 C}$, and note that (3.6) leads to

$$
12 C \lambda h^{1 / 2} z \leqslant 1
$$

Consequently, the definition of $R$ leads to $z \leqslant \frac{R}{2}$, and then, we can gather the previous inequalities together to prove

$$
\begin{aligned}
\left(\mathscr{N}\left(\boldsymbol{u}_{h}\right), \boldsymbol{u}_{h}\right) & \geqslant\left(\frac{1}{2}-\frac{1}{6}-\frac{3}{72}\right) R^{2}-z^{2}+x^{2}+\frac{1}{2} t^{2}+\frac{1}{2} y^{2}+w^{2} \\
& \geqslant \frac{1}{4} R^{2}-z^{2}+\frac{1}{2} y^{2}+x^{2}+\frac{1}{2} t^{2}+w^{2} \\
& \geqslant x^{2}+\frac{1}{2} y^{2}+\frac{1}{2} t^{2}+w^{2} \geqslant 0 .
\end{aligned}
$$

We conclude from Brouwer's fixed point Theorem (see Chapter IV, Corollary 1.1 in Girault \& Raviart (1986)) that there exists a function $\boldsymbol{u}_{h, \lambda} \in \boldsymbol{H}_{h}$ such that $\left|\boldsymbol{u}_{h, \lambda}\right|_{1, \Omega} \leqslant R$ and $\mathscr{N}\left(\boldsymbol{u}_{h, \lambda}\right)=\mathbf{0}$.

Now, we head to the question of uniqueness. To this end, we assume that $\lambda$ is "small enough" such that $\alpha_{K}=\gamma_{K}=1$ on every element $K \in \mathscr{T}_{h}$. Also, on each edge (face) $F \in \mathscr{E}_{h}$ we take $\tilde{\tau}_{F}=\frac{h_{F}}{12}$ as both expressions are equivalent in the diffusion dominated case (see Lemma 2 in Barrenechea \& Valentin (2010b) for details). Then, the method (3.4) simplifies to: Find $\left(\boldsymbol{u}_{h, \lambda}, p_{h, \lambda}\right) \in \boldsymbol{H}_{h} \times Q_{h}$ such that

$$
\begin{align*}
& \left(\nabla \boldsymbol{u}_{h, \lambda}, \nabla \boldsymbol{v}_{h}\right)+\lambda\left(\left(\nabla \boldsymbol{u}_{h, \lambda}\right) \boldsymbol{u}_{h, \lambda}, \boldsymbol{v}_{h}\right)-\left(p_{h, \lambda}, \nabla \cdot \boldsymbol{v}_{h}\right)+\left(q_{h}, \nabla \cdot \boldsymbol{u}_{h, \lambda}\right) \\
& +\sum_{K \in \mathscr{T}}\left(\chi_{h}\left(p_{h, \lambda}\right), \chi_{h}\left(q_{h}\right)\right)_{K}+\sum_{K \in \mathscr{T}_{h}}\left(p_{e}^{K}\left(\lambda\left(\nabla \boldsymbol{u}_{h, \lambda}\right) \boldsymbol{u}_{h, \lambda}\right), p_{e}^{K}\left(\lambda\left(\nabla \boldsymbol{v}_{h}\right) \boldsymbol{u}_{h, \lambda}\right)\right)_{K} \\
& +\sum_{K \in \mathscr{T}}\left(\lambda \chi_{h}\left(\boldsymbol{x} \nabla \cdot \boldsymbol{u}_{h, \lambda}\right), \lambda \chi_{h}\left(\boldsymbol{x} \nabla \cdot \boldsymbol{v}_{h}\right)\right)_{K}+\sum_{F \in \mathscr{E}_{h}} \frac{h_{F}}{12}\left(\llbracket p_{h, \lambda} \rrbracket, \llbracket q_{h} \rrbracket\right)_{F}=\left(\boldsymbol{f}, \boldsymbol{v}_{h}\right), \tag{3.9}
\end{align*}
$$

for all $\left(\boldsymbol{v}_{h}, q_{h}\right) \in \boldsymbol{H}_{h} \times Q_{h}$. Next, method (3.9) is written as a fixed point problem through the mapping $G_{h}: \Lambda \times H^{2}\left(\mathscr{T}_{h}\right)^{d} \times H^{1}\left(\mathscr{T}_{h}\right) \longrightarrow \boldsymbol{H}_{h} \times Q_{h}$, where $G_{h}(\boldsymbol{\lambda}, \boldsymbol{z}, t)=\left(\boldsymbol{w}_{h}, r_{h}\right)$ is such that

$$
\left(\boldsymbol{w}_{h}, \boldsymbol{v}_{h}\right)+\left(r_{h}, q_{h}\right)=-\left(\boldsymbol{f}-\boldsymbol{\lambda}(\nabla \boldsymbol{z}) \boldsymbol{z}, \boldsymbol{v}_{h}\right)+\sum_{K \in \mathscr{\mathscr { H }}}\left(p_{e}^{K}(\boldsymbol{\lambda}(\nabla \boldsymbol{z}) \boldsymbol{z}), p_{e}^{K}\left(\boldsymbol{\lambda}\left(\nabla \boldsymbol{v}_{h}\right) \boldsymbol{z}\right)\right)_{K}
$$

for all $\left(\boldsymbol{v}_{h}, q_{h}\right) \in \boldsymbol{H}_{h} \times Q_{h}$. As a result, problem (3.9) is analogous to the following problem

$$
\begin{equation*}
F_{h}\left(\lambda, \boldsymbol{u}_{h, \lambda}, p_{h, \lambda}\right):=\left(\boldsymbol{u}_{h, \lambda}, p_{h, \lambda}\right)+T_{h} G_{h}\left(\lambda, \boldsymbol{u}_{h, \lambda}, p_{h, \lambda}\right)=\mathbf{0} . \tag{3.10}
\end{equation*}
$$

We are ready to present the uniqueness result.
Theorem 3.2 Provide that $\lambda$ is "sufficiently small", in the sense that

$$
\lambda(1+\lambda)(1+\lambda h)^{2}<C
$$

where $C$ is a given positive constant independent of $h$, the solution of problem (3.9) is unique.
Proof. First, observe that a solution of (3.9) is a fixed point of the operator $-T_{h} G_{h}$ using (3.10). Thereby, the proof reduces to show that the operator $-T_{h} G_{h}$ is a strict contraction in the ball $B:=$ $\left\{\left(\boldsymbol{v}_{h}, q_{h}\right) \in \boldsymbol{H}_{h} \times Q_{h}:\| \|\left(\boldsymbol{v}_{h}, q_{h}\right) \| \leqslant 1\right\}$, and use Banach's fixed point Theorem.

Let $\left(\boldsymbol{u}_{h}, p_{h}\right),\left(\boldsymbol{v}_{h}, q_{h}\right) \in B$. From Lemma 2.4 and the definition of operators $T_{h}$ and $G_{h}$, it holds

$$
\begin{align*}
& \left\|T_{h} G_{h}\left(\lambda, \boldsymbol{u}_{h}, p_{h}\right)-T_{h} G_{h}\left(\lambda, \boldsymbol{v}_{h}, q_{h}\right)\right\| \leqslant C(1+\lambda h)^{2} \sup _{\left\|\left(\boldsymbol{w}_{h}, t_{h}\right)\right\| \leqslant 1}\left(G_{h}\left(\lambda, \boldsymbol{u}_{h}, p_{h}\right)-G_{h}\left(\lambda, \boldsymbol{v}_{h}, q_{h}\right),\left(\boldsymbol{w}_{h}, t_{h}\right)\right) \\
& \leqslant C(1+\lambda h)^{2} \sup _{\left\|\left(\boldsymbol{w}_{h}, t_{h}\right)\right\| \leqslant 1}\left\{\lambda\left(\left(\nabla \boldsymbol{u}_{h}\right) \boldsymbol{u}_{h}-\left(\nabla \boldsymbol{v}_{h}\right) \boldsymbol{v}_{h}, \boldsymbol{w}_{h}\right)+\sum_{K \in \mathscr{T}_{h}}\left(p_{e}^{K}\left(\lambda\left(\nabla \boldsymbol{u}_{h}\right) \boldsymbol{u}_{h}\right), p_{e}^{K}\left(\lambda\left(\nabla \boldsymbol{w}_{h}\right) \boldsymbol{u}_{h}\right)\right)_{K}\right. \\
& \left.-\sum_{K \in \mathscr{T}}\left(p_{e}^{K}\left(\lambda\left(\nabla \boldsymbol{v}_{h}\right) \boldsymbol{v}_{h}\right), p_{e}^{K}\left(\lambda\left(\nabla \boldsymbol{w}_{h}\right) \boldsymbol{v}_{h}\right)\right)_{K}\right\} \\
& \leqslant C(1+\lambda h)^{2} \sup _{\left\|\left(\boldsymbol{w}_{h}, t_{h}\right)\right\| \leqslant 1}\left\{\lambda\left(\left(\nabla \boldsymbol{u}_{h}\right) \boldsymbol{u}_{h}-\left(\nabla \boldsymbol{v}_{h}\right) \boldsymbol{v}_{h}, \boldsymbol{w}_{h}\right)+\sum_{K \in \mathscr{T}_{h}}\left(p_{e}^{K}\left(\lambda\left(\nabla \boldsymbol{u}_{h}\right) \boldsymbol{u}_{h}\right), p_{e}^{K}\left(\lambda\left(\nabla \boldsymbol{w}_{h}\right)\left(\boldsymbol{u}_{h}-\boldsymbol{v}_{h}\right)\right)\right)_{K}\right. \\
& +\sum_{K \in \mathscr{T}}\left(p_{e}^{K}\left(\lambda\left(\left(\nabla \boldsymbol{u}_{h}\right) \boldsymbol{u}_{h}-\left(\nabla \boldsymbol{v}_{h}\right) \boldsymbol{v}_{h}\right), p_{e}^{K}\left(\lambda\left(\nabla \boldsymbol{w}_{h}\right) \boldsymbol{v}_{h}\right)\right)_{K}\right\} \\
& =C(1+\lambda h)^{2} \sup _{\left\|\left(\boldsymbol{w}_{h}, t_{h}\right)\right\| \leqslant 1}\{\mathrm{I}+\mathrm{II}+\mathrm{III}\} . \tag{3.11}
\end{align*}
$$

We will estimate each term in the right-hand side of (3.11). First, using (2.3), and the following identity

$$
\left(\nabla \boldsymbol{u}_{h}\right) \boldsymbol{u}_{h}-\left(\nabla \boldsymbol{v}_{h}\right) \boldsymbol{v}_{h}=\nabla\left(\boldsymbol{u}_{h}-\boldsymbol{v}_{h}\right) \boldsymbol{u}_{h}+\nabla \boldsymbol{v}_{h}\left(\boldsymbol{u}_{h}-\boldsymbol{v}_{h}\right)
$$

and the definition of the norm $\|\cdot \mid\|$, we get

$$
\begin{equation*}
\mathrm{I} \leqslant C \lambda\left\|\left(\boldsymbol{u}_{h}, p_{h}\right)-\left(\boldsymbol{v}_{h}, q_{h}\right)\right\|\| \|\left(\boldsymbol{w}_{h}, t_{h}\right) \| . \tag{3.12}
\end{equation*}
$$

Next, from (2.5) with $m=0, l=1$ and $p=q=4$, (3.2), Hölder, Cauchy-Schwarz and Poincaré inequal-
ities, the inclusion $H^{1}(\Omega) \hookrightarrow L^{4}(\Omega)$ and the definition of the norm $\|\|\cdot\|$, we obtain

$$
\begin{align*}
\mathrm{II} & =\sum_{K \in \mathscr{T}_{h}}\left(p_{e}^{K}\left(\lambda\left(\nabla \boldsymbol{u}_{h}\right) \boldsymbol{u}_{h}\right), p_{e}^{K}\left(\lambda\left(\nabla \boldsymbol{w}_{h}\right)\left(\boldsymbol{u}_{h}-\boldsymbol{v}_{h}\right)\right)\right)_{K} \\
& \leqslant C \sum_{K \in \mathscr{T}} \lambda^{2} h_{K}^{2}\left\|\left(\nabla \boldsymbol{u}_{h}\right) \boldsymbol{u}_{h}\right\|_{0, K}\left\|\left(\nabla \boldsymbol{w}_{h}\right)\left(\boldsymbol{u}_{h}-\boldsymbol{v}_{h}\right)\right\|_{0, K} \\
& \leqslant C \sum_{K \in \mathscr{T}_{h}} \lambda^{2} h_{K}^{2}\left\|\nabla \boldsymbol{u}_{h}\right\|_{0,4, K}\left\|\boldsymbol{u}_{h}\right\|_{0,4, K}\left\|\nabla \boldsymbol{w}_{h}\right\|_{0,4, K}\left\|\boldsymbol{u}_{h}-\boldsymbol{v}_{h}\right\|_{0,4, K} \\
& \leqslant C \lambda^{2} \sum_{K \in \mathscr{T}_{h}} h_{K}^{2} h_{K}^{-1}\left\|\boldsymbol{u}_{h}\right\|_{0,4, K}\left\|\boldsymbol{u}_{h}\right\|_{0,4, K} h_{K}^{-1}\left\|\boldsymbol{w}_{h}\right\|_{0,4, K}\left\|\boldsymbol{u}_{h}-\boldsymbol{v}_{h}\right\|_{0,4, K} \\
& \leqslant C \lambda^{2}\left\|\left(\boldsymbol{u}_{h}, p_{h}\right)\right\|\left\|^{2}\right\|\left(\boldsymbol{u}_{h}, p_{h}\right)-\left(\boldsymbol{v}_{h}, q_{h}\right)\| \|\left\|\left(\boldsymbol{w}_{h}, t_{h}\right)\right\| \\
& \leqslant C \lambda^{2}\left\|\left(\boldsymbol{u}_{h}, p_{h}\right)-\left(\boldsymbol{v}_{h}, q_{h}\right)\right\|\| \|\left(\boldsymbol{w}_{h}, t_{h}\right) \| . \tag{3.13}
\end{align*}
$$

Using similar arguments, we get

$$
\begin{align*}
\text { III } & =\sum_{K \in \mathscr{T h}}\left(p_{e}^{K}\left(\lambda\left(\left(\nabla \boldsymbol{u}_{h}\right) \boldsymbol{u}_{h}-\left(\nabla \boldsymbol{v}_{h}\right) \boldsymbol{v}_{h}\right)\right), p_{e}^{K}\left(\boldsymbol{\lambda}\left(\nabla \boldsymbol{w}_{h}\right) \boldsymbol{v}_{h}\right)\right)_{K} \\
& \leqslant C \lambda^{2} \sum_{K \in \mathscr{T}_{h}} h_{K}^{2}\left\|\left(\nabla \boldsymbol{u}_{h}\right) \boldsymbol{u}_{h}-\left(\nabla \boldsymbol{v}_{h}\right) \boldsymbol{v}_{h}\right\|_{0, K}\left\|\nabla \boldsymbol{w}_{h}\right\|_{0,4, K}\left\|\boldsymbol{v}_{h}\right\|_{0,4, K} \\
& \leqslant C \lambda^{2}\left\{\left\|\left(\boldsymbol{u}_{h}, p_{h}\right)\right\|+\| \|\left(\boldsymbol{v}_{h}, q_{h}\right) \|\right\}\| \|\left(\boldsymbol{u}_{h}, p_{h}\right)-\left(\boldsymbol{v}_{h}, q_{h}\right)\| \|\left\|\left(\boldsymbol{v}_{h}, q_{h}\right)\right\|\| \|\left(\boldsymbol{w}_{h}, t_{h}\right) \| \\
& \leqslant C \lambda^{2}\| \|\left(\boldsymbol{u}_{h}, p_{h}\right)-\left(\boldsymbol{v}_{h}, q_{h}\right)\| \|\left\|\left(\boldsymbol{w}_{h}, t_{h}\right)\right\| . \tag{3.14}
\end{align*}
$$

Now, replacing (3.12), (3.13) and (3.14), in (3.11), we see that

$$
\left\|T_{h} G_{h}\left(\lambda, \boldsymbol{u}_{h}, p_{h}\right)-T_{h} G_{h}\left(\lambda, \boldsymbol{v}_{h}, q_{h}\right)\right\| \leqslant C \lambda(1+\lambda)(1+\lambda h)^{2}\| \|\left(\boldsymbol{u}_{h}, p_{h}\right)-\left(\boldsymbol{v}_{h}, q_{h}\right) \|
$$

and then the result follows if $\lambda$ is such that $C \lambda(1+\lambda)(1+\lambda h)^{2}<1$.

## 4. Error analysis

This section establishes a convergence result for the LPS method by extending the ideas proposed in Araya et al. (2012) for the RELP method. We place the method at the diffusion dominated regime for which the well-posedness is assured. The first result establishes that the differential operator $D_{u, p} F_{h}\left(\lambda, \mathscr{I}_{h} \boldsymbol{u}_{\lambda}, \mathscr{J}_{h} p_{\lambda}\right)$ is an isomorphism under appropriate conditions on $h$ and $\lambda$. This result is key for the forthcoming error analysis.

LEMMA 4.1 Assume that a regular branch $\lambda \rightarrow\left(\boldsymbol{u}_{\lambda}, p_{\lambda}\right)$ of solutions of problem (2.17) exists on a given compact interval $\Lambda \subset \mathbb{R}$. Moreover, assume that $\left(\boldsymbol{u}_{\lambda}, p_{\lambda}\right)$ belongs to the space $H^{2}(\Omega)^{d} \times H^{1}(\Omega)$. Then, there exists a constant $h_{0}>0$ such that, for all $h \leqslant h_{0}$, the mapping $D_{\boldsymbol{u}, p} F_{h}\left(\lambda, \mathscr{F}_{h} \boldsymbol{u}_{\lambda}, \mathscr{J}_{h} p_{\lambda}\right)$ is an isomorphism onto $\boldsymbol{H}_{h} \times Q_{h}$ and

$$
\begin{equation*}
\left\|\left\{D_{\boldsymbol{u}, p} F_{h}\left(\lambda, \mathscr{I}_{h} \boldsymbol{u}_{\lambda}, \mathscr{J}_{h} p_{\lambda}\right)\right\}^{-1}\right\|_{\mathscr{L}\left(\boldsymbol{H}_{h} \times Q_{h}\right)} \leqslant 8\left\|\left\{D_{\boldsymbol{u}, p} F\left(\lambda, \boldsymbol{u}_{\lambda}, p_{\lambda}\right)\right\}^{-1}\right\|_{\mathscr{L}(\boldsymbol{H} \times Q)} . \tag{4.1}
\end{equation*}
$$

Proof. We start noting that, as $T$ is a linear and continuous operator, from (2.3) and (2.9) we get

$$
\left\|D_{\boldsymbol{u}, p} F\left(\lambda, \boldsymbol{u}_{\lambda}, p_{\lambda}\right)-D_{\boldsymbol{u}, p} F\left(\lambda, \mathscr{I}_{h} \boldsymbol{u}_{\lambda}, \mathscr{J}_{h} p_{\lambda}\right)\right\|_{\mathscr{L}(\boldsymbol{H} \times Q)} \leqslant C \lambda h L
$$

where

$$
\begin{equation*}
L:=\sup _{\lambda \in \Lambda} \max \left\{\|\boldsymbol{f}\|_{0, \Omega},\left\|\boldsymbol{u}_{\lambda}\right\|_{2, \Omega},\left\|p_{\lambda}\right\|_{1, \Omega}\right\} . \tag{4.2}
\end{equation*}
$$

Now, consider the linear operator $\mathscr{B} \in \mathscr{L}(\boldsymbol{H} \times Q)$ defined by

$$
\mathscr{B}:=\left\{D_{\boldsymbol{u}, p} F\left(\lambda, \boldsymbol{u}_{\lambda}, p_{\lambda}\right)\right\}^{-1}\left[D_{\boldsymbol{u}, p} F\left(\boldsymbol{\lambda}, \boldsymbol{u}_{\lambda}, p_{\lambda}\right)-D_{\boldsymbol{u}, p} F\left(\boldsymbol{\lambda}, \mathscr{I}_{h} \boldsymbol{u}_{\lambda}, \mathscr{J}_{h} p_{\lambda}\right)\right] .
$$

Observe that $D_{\boldsymbol{u}, p} F\left(\boldsymbol{\lambda}, \mathscr{I}_{h} \boldsymbol{u}_{\lambda}, \mathscr{J}_{h} p_{\lambda}\right)=D_{\boldsymbol{u}, p} F\left(\boldsymbol{\lambda}, \boldsymbol{u}_{\lambda}, p_{\lambda}\right)(\mathrm{I}-\mathscr{B})$ and since it holds

$$
\lim _{h \rightarrow 0}\left\|\left\{D_{\boldsymbol{u}, p} F\left(\lambda, \boldsymbol{u}_{\lambda}, p_{\lambda}\right)\right\}^{-1}\right\|_{\mathscr{L}(\boldsymbol{H} \times Q)}\left\|D_{\boldsymbol{u}, p} F\left(\lambda, \boldsymbol{u}_{\lambda}, p_{\lambda}\right)-D_{\boldsymbol{u}, p} F\left(\lambda, \mathscr{I}_{h} \boldsymbol{u}_{\lambda}, \mathscr{J}_{h} p_{\lambda}\right)\right\|_{\mathscr{L}(\boldsymbol{H} \times Q)}=0
$$

then there exists $h_{2}>0$ such that $\|\mathscr{B}\|_{\mathscr{L}(\boldsymbol{H} \times Q)} \leqslant \frac{1}{2}$ for all $h \leqslant h_{2}$. As such, I- $\mathscr{B}$ is an isomorphism onto $\boldsymbol{H} \times Q$ and

$$
\begin{equation*}
\left\|(\mathrm{I}-\mathscr{B})^{-1}\right\|_{\mathscr{L}(\boldsymbol{H} \times Q)} \leqslant \frac{1}{1-\|\mathscr{B}\|_{\mathscr{L}(\boldsymbol{H} \times Q)}} \leqslant 2 . \tag{4.3}
\end{equation*}
$$

We conclude that $D_{\boldsymbol{u}, p} F\left(\boldsymbol{\lambda}, \mathscr{I}_{h} \boldsymbol{u}_{\lambda}, \mathscr{J}_{h} p_{\lambda}\right)$ is also an isomorphism of $\boldsymbol{H} \times Q$ into itself for all $h \leqslant h_{2}$ and

$$
\begin{equation*}
\left\|\left\{D_{\boldsymbol{u}, p} F\left(\lambda, \mathscr{I}_{h} \boldsymbol{u}_{\lambda}, \mathscr{J}_{h} p_{\lambda}\right)\right\}^{-1}\right\|_{\mathscr{L}(\boldsymbol{H} \times Q)} \leqslant 2\left\|\left\{D_{\boldsymbol{u}, p} F\left(\lambda, \boldsymbol{u}_{\lambda}, p_{\lambda}\right)\right\}^{-1}\right\|_{\mathscr{L}(\boldsymbol{H} \times Q)} . \tag{4.4}
\end{equation*}
$$

Now, notice that

$$
\begin{equation*}
D_{\boldsymbol{u}, p} F_{h}\left(\lambda, \mathscr{I}_{h} \boldsymbol{u}_{\lambda}, \mathscr{J}_{h} p_{\lambda}\right)=T_{h}\left[D_{\boldsymbol{u}, p} G_{h}\left(\lambda, \mathscr{I}_{h} \boldsymbol{u}_{\lambda}, \mathscr{J}_{h} p_{\lambda}\right)-D_{\boldsymbol{u}, p} G\left(\lambda, \mathscr{I}_{h} \boldsymbol{u}_{\lambda}, \mathscr{J}_{h} p_{\lambda}\right)\right]+\mathscr{A}_{1}, \tag{4.5}
\end{equation*}
$$

where the mapping $\mathscr{A}_{1}:=\mathrm{I}+T_{h} D_{\boldsymbol{u}, p} G\left(\lambda, \mathscr{I}_{h} \boldsymbol{u}_{\lambda}, \mathscr{J}_{h} p_{\lambda}\right)$, belongs to $\mathscr{L}(\boldsymbol{H} \times Q)$, but also to $\mathscr{L}\left(\boldsymbol{H}_{h} \times Q_{h}\right)$. Then, we use Lemma 2.4, Hölder's inequality, (2.11), (2.12), and the inclusions $H^{2}(\Omega) \hookrightarrow L^{\infty}(\Omega)$ and $H^{1}(\Omega) \hookrightarrow L^{4}(\Omega)$, to conclude that

$$
\left\|\mathscr{A}_{1}-D_{\boldsymbol{u}, p} F\left(\lambda, \mathscr{I}_{h} \boldsymbol{u}_{\lambda}, \mathscr{J}_{h} p_{\lambda}\right)\right\|_{\mathscr{L}(\boldsymbol{H} \times Q)} \leqslant C(1+\lambda h)^{2} \lambda h L .
$$

As a result, there exists $h_{1} \leqslant h_{2}$ such that for all $h \leqslant h_{1}$, the mapping $\mathscr{A}_{1}$ is an isomorphism onto $\boldsymbol{H} \times Q$, and using (4.3), it holds

$$
\left\|\mathscr{A}_{1}^{-1}\right\|_{\mathscr{L}(\boldsymbol{H} \times Q)} \leqslant 2\left\|\left\{D_{\boldsymbol{u}, p} F\left(\lambda, \mathscr{I}_{h} \boldsymbol{u}_{\lambda}, \mathscr{J}_{h} p_{\lambda}\right)\right\}^{-1}\right\|_{\mathscr{L}(\boldsymbol{H} \times Q)} .
$$

In addition, since $\mathscr{A}_{1}$ maps $\boldsymbol{H}_{h} \times Q_{h}$ onto itself and is a injective operator, then it is also an isomorphism onto $\boldsymbol{H}_{h} \times Q_{h}$ and

$$
\begin{equation*}
\left\|\mathscr{A}_{1}^{-1}\right\|_{\mathscr{L}\left(\boldsymbol{H}_{h} \times Q_{h}\right)} \leqslant\left\|\mathscr{A}_{1}^{-1}\right\|_{\mathscr{L}(\boldsymbol{H} \times Q)} \leqslant 2\left\|\left\{D_{\boldsymbol{u}, p} F\left(\lambda, \mathscr{I}_{h} \boldsymbol{u}_{\lambda}, \mathscr{J}_{h} p_{\lambda}\right)\right\}^{-1}\right\|_{\mathscr{L}(\boldsymbol{H} \times Q)} \tag{4.6}
\end{equation*}
$$

Next, using Lemma 2.4 and (4.5), it holds

$$
\begin{aligned}
& \left\|\mathscr{A}_{1}-D_{\boldsymbol{u}, p} F_{h}\left(\lambda, \mathscr{I}_{h} \boldsymbol{u}_{\lambda}, \mathscr{J}_{h} p_{\lambda}\right)\right\|_{\mathscr{L}\left(\boldsymbol{H}_{h} \times Q_{h}\right)} \\
= & \sup _{\| \|\left(\boldsymbol{v}_{h}, q_{h}\right) \| \leqslant 1}\left\|T_{h}\left(D_{\boldsymbol{u}, p} \boldsymbol{G}_{h}\left(\lambda, \mathscr{I}_{h} \boldsymbol{u}_{\lambda}, \mathscr{J}_{h} p_{\lambda}\right)-D_{\boldsymbol{u}, p} G\left(\lambda, \mathscr{I}_{h} \boldsymbol{u}_{\lambda}, \mathscr{J}_{h} p_{\lambda}\right)\right)\left[\boldsymbol{v}_{h}, q_{h}\right]\right\| \\
\leqslant & C(1+\lambda h)^{2} \sup _{\left\|\left(\boldsymbol{v}_{h}, q_{h}\right)\right\| \leqslant 1}\left\|\left(D_{\boldsymbol{u}, p} G_{h}\left(\lambda, \mathscr{I}_{h} \boldsymbol{u}_{\lambda}, \mathscr{J}_{h} p_{\lambda}\right)-D_{\boldsymbol{u}, p} G\left(\lambda, \mathscr{I}_{h} \boldsymbol{u}_{\lambda}, \mathscr{J}_{h} p_{\lambda}\right)\right)\left[\boldsymbol{v}_{h}, q_{h}\right]\right\|_{\left(\boldsymbol{H}_{h} \times Q_{h}\right)^{\prime}} \\
\leqslant & C(1+\lambda h)^{2} \sup _{\left\|\left(\boldsymbol{w}_{h}, t_{h}\right)\right\| \leqslant 1} \sup _{\left\|\left(\boldsymbol{v}_{h}, q_{h}\right)\right\| \leqslant 1}\left\{\sum_{K \in \mathscr{T}_{h}}\left(p_{e}^{K}\left(\lambda\left(\nabla \mathscr{I}_{h} \boldsymbol{u}_{\lambda}\right) \mathscr{I}_{h} \boldsymbol{u}_{\lambda}\right), p_{e}^{K}\left(\lambda\left(\nabla \boldsymbol{w}_{h}\right) \boldsymbol{v}_{h}\right)\right)_{K}\right. \\
& \left.+\sum_{K \in \mathscr{T}_{h}}\left(p_{e}^{K}\left(\lambda\left(\nabla \boldsymbol{v}_{h}\right) \mathscr{I}_{h} \boldsymbol{u}_{\lambda}+\lambda\left(\nabla \mathscr{I}_{h} \boldsymbol{u}_{\lambda}\right) \boldsymbol{v}_{h}\right), p_{e}^{K}\left(\lambda\left(\nabla \boldsymbol{w}_{h}\right) \mathscr{I}_{h} \boldsymbol{u}_{\lambda}\right)\right)_{K}\right\} \\
= & C(1+\lambda h)^{2} \sup _{\left\|\left(\boldsymbol{w}_{h}, t_{h}\right)\right\| \leqslant 1} \sup _{\left\|\left(\boldsymbol{v}_{h}, q_{h}\right)\right\| \leqslant 1}\{\mathrm{I}+\mathrm{II}\} .
\end{aligned}
$$

Let us estimate the right-hand side above. From (2.9), (2.5) with $l=1, m=0$ and $p=q=\infty$, (2.12) and the embedding $H^{2}(\Omega) \hookrightarrow L^{\infty}(\Omega)$, we obtain

$$
\begin{align*}
& \left\|\left(\nabla \boldsymbol{u}_{\lambda}\right) \boldsymbol{u}_{\lambda}-\left(\nabla \mathscr{I}_{h} \boldsymbol{u}_{\lambda}\right) \mathscr{I}_{h} \boldsymbol{u}_{\lambda}\right\|_{0, K} \\
\leqslant & \left\|\nabla\left(\boldsymbol{u}_{\lambda}-\mathscr{I}_{h} \boldsymbol{u}_{\lambda}\right) \boldsymbol{u}_{\lambda}\right\|_{0, K}+\left\|\left(\nabla \mathscr{I}_{h} \boldsymbol{u}_{\lambda}\right)\left(\boldsymbol{u}_{\lambda}-\mathscr{I}_{h} \boldsymbol{u}_{\lambda}\right)\right\|_{0, K} \\
\leqslant & \left|\boldsymbol{u}_{\lambda}-\mathscr{I}_{h} \boldsymbol{u}_{\lambda}\right|_{1, K}\left\|\boldsymbol{u}_{\lambda}\right\|_{\infty, K}+\left\|\nabla \mathscr{I}_{h} \boldsymbol{u}_{\lambda}\right\|_{\infty, K}\left\|\boldsymbol{u}_{\lambda}-\mathscr{I}_{h} \boldsymbol{u}_{\lambda}\right\|_{0, K} \\
\leqslant & C h_{K}\left\|\boldsymbol{u}_{\lambda}\right\|_{2, K}\left\|\boldsymbol{u}_{\lambda}\right\|_{\infty, K}+C h_{K}^{-1}\left\|\mathscr{I}_{h} \boldsymbol{u}_{\lambda}\right\|_{\infty, K} C h_{K}^{2}\left\|\boldsymbol{u}_{\lambda}\right\|_{2, K} \\
\leqslant & C h_{K} L\left\|\boldsymbol{u}_{\lambda}\right\|_{2, K} . \tag{4.7}
\end{align*}
$$

Also, using the same arguments, we get

$$
\begin{equation*}
\left\|\lambda\left(\nabla \mathscr{I}_{h} \boldsymbol{u}_{\lambda}\right) \mathscr{I}_{h} \boldsymbol{u}_{\lambda}\right\|_{0, K} \leqslant C L \lambda\left\|\boldsymbol{u}_{\lambda}\right\|_{2, K} \tag{4.8}
\end{equation*}
$$

We estimate item I using Lemma 3.1, (4.8) and (2.5) with $l=1, m=0, p=q=4$, Poincaré and Hölder inequalities and the inclusion $H^{1}(\Omega) \hookrightarrow L^{4}(\Omega)$, as follows

$$
\begin{align*}
\mathrm{I} & =\sum_{K \in \mathscr{T}_{h}}\left(p_{e}^{K}\left(\lambda\left(\nabla \mathscr{I}_{h} \boldsymbol{u}_{\lambda}\right) \mathscr{I}_{h} \boldsymbol{u}_{\lambda}\right), p_{e}^{K}\left(\lambda\left(\nabla \boldsymbol{w}_{h}\right) \boldsymbol{v}_{h}\right)\right)_{K} \\
& \leqslant C \sum_{K \in \mathscr{T}_{h}} \lambda h_{K}^{2}\left\|\lambda\left(\nabla \mathscr{I}_{h} \boldsymbol{u}_{\lambda}\right) \mathscr{I}_{h} \boldsymbol{u}_{\lambda}\right\|_{0, K}\left\|\left(\nabla \boldsymbol{w}_{h}\right) \boldsymbol{v}_{h}\right\|_{0, K} \\
& \leqslant C \sum_{K \in \mathscr{T}_{h}} \lambda^{2} h_{K}^{2} L\left\|\boldsymbol{u}_{\lambda}\right\|_{2, K}\left\|\nabla \boldsymbol{w}_{h}\right\|_{0,4, K}\left\|\boldsymbol{v}_{h}\right\|_{0,4, K} \\
& \leqslant C \sum_{K \in \mathscr{T}_{h}} \lambda^{2} h_{K}^{2} L\left\|\boldsymbol{u}_{\lambda}\right\|_{2, K} h_{K}^{-1}\left\|\boldsymbol{w}_{h}\right\|_{0,4, K}\left\|\boldsymbol{v}_{h}\right\|_{0,4, K} \\
& \leqslant C \lambda^{2} L^{2} h\left\|\left(\boldsymbol{w}_{h}, t_{h}\right)\right\|\| \|\left(\boldsymbol{v}_{h}, q_{h}\right) \| . \tag{4.9}
\end{align*}
$$

Concerning item II, we use again Lemma 3.1, the embeddings of $H^{2}(\Omega) \hookrightarrow L^{\infty}(\Omega)$ and $H^{1}(\Omega) \hookrightarrow$ $L^{4}(\Omega),(2.5)$ with $l=1, m=0, p=q=4,(2.12),(2.10)$ and Poincaré and Hölder inequalities, to get

$$
\begin{align*}
& \mathrm{II}=\sum_{K \in \mathscr{T}_{h}}\left(p_{e}^{K}\left(\lambda\left(\nabla \boldsymbol{v}_{h}\right) \mathscr{I}_{h} \boldsymbol{u}_{\lambda}+\lambda\left(\nabla \mathscr{I}_{h} \boldsymbol{u}_{\lambda}\right) \boldsymbol{v}_{h}\right), p_{e}^{K}\left(\lambda\left(\nabla \boldsymbol{w}_{h}\right) \mathscr{I}_{h} \boldsymbol{u}_{\lambda}\right)\right)_{K} \\
& \leqslant C \lambda^{2} \sum_{K \in \mathscr{T}_{h}}\left\|p_{e}^{K}\left(\left(\nabla \boldsymbol{v}_{h}\right) \mathscr{I}_{h} \boldsymbol{u}_{\lambda}+\left(\nabla \mathscr{I}_{h} \boldsymbol{u}_{\lambda}\right) \boldsymbol{v}_{h}\right)\right\|_{0, K}\left\|p_{e}^{K}\left(\left(\nabla \boldsymbol{w}_{h}\right) \mathscr{I}_{h} \boldsymbol{u}_{\lambda}\right)\right\|_{0, K} \\
& \leqslant C \lambda^{2} \sum_{K \in \mathscr{T}_{h}} h_{K}^{2}\left\|\left(\nabla \boldsymbol{v}_{h}\right) \mathscr{I}_{h} \boldsymbol{u}_{\lambda}+\left(\nabla \mathscr{I}_{h} \boldsymbol{u}_{\lambda}\right) \boldsymbol{v}_{h}\right\|_{0, K}\left\|\left(\nabla \boldsymbol{w}_{h}\right) \mathscr{I}_{h} \boldsymbol{u}_{\lambda}\right\|_{0, K} \\
& \leqslant C \lambda^{2} \sum_{K \in \mathscr{T}_{h}} h_{K}^{2}\left\{\left\|\nabla \boldsymbol{v}_{h}\right\|_{0, K}\left\|\mathscr{I}_{h} \boldsymbol{u}_{\lambda}\right\|_{\infty, K}+\left\|\nabla \mathscr{I}_{h} \boldsymbol{u}_{\lambda}\right\|_{0,4, K}\left\|\boldsymbol{v}_{h}\right\|_{0,4, K}\right\}\left\|\nabla \boldsymbol{w}_{h}\right\|_{0, K}\left\|\mathscr{I}_{h} \boldsymbol{u}_{\lambda}\right\|_{\infty, K} \\
& \leqslant C \lambda^{2} \sum_{K \in \mathscr{T}_{h}} h_{K}^{2}\left\{\left\|\nabla \boldsymbol{v}_{h}\right\|_{0, K}\left\|\boldsymbol{u}_{\lambda}\right\|_{\infty, K}+h_{K}^{-1}\left\|\mathscr{I}_{h} \boldsymbol{u}_{\lambda}\right\|_{0,4, K}\left\|\boldsymbol{v}_{h}\right\|_{0,4, K}\right\}\left\|\nabla \boldsymbol{w}_{h}\right\|_{0, K}\left\|\boldsymbol{u}_{\lambda}\right\|_{\infty, K} \\
& \leqslant C \lambda^{2} L^{2} h(1+h)\left\|\left(\boldsymbol{v}_{h}, q_{h}\right)\right\|\left\|\left(\boldsymbol{w}_{h}, t_{h}\right)\right\| . \tag{4.10}
\end{align*}
$$

Therefore, from (4.9) and (4.10) it follows that

$$
\left\|\mathscr{A}_{1}-D_{\boldsymbol{u}, p} F_{h}\left(\lambda, \mathscr{I}_{h} \boldsymbol{u}_{\lambda}, \mathscr{J}_{h} p_{\lambda}\right)\right\|_{\mathscr{L}\left(\boldsymbol{H}_{h} \times Q_{h}\right)} \leqslant C h(1+\lambda h)^{2}(1+h) \lambda^{2} L^{2}
$$

and it results that there exists $h_{0} \leqslant h_{1}$ such that for all $h \leqslant h_{0}$ the mapping $D_{\boldsymbol{u}, p} F_{h}\left(\lambda, \mathscr{I}_{h} \boldsymbol{u}_{\lambda}, \mathscr{J}_{h} p_{\lambda}\right)$ is an isomorphism of $\boldsymbol{H}_{h} \times Q_{h}$ into itself and

$$
\begin{equation*}
\left\|\left\{D_{\boldsymbol{u}, p} F_{h}\left(\lambda, \mathscr{I}_{h} \boldsymbol{u}_{\lambda}, \mathscr{J}_{h} p_{\lambda}\right)\right\}^{-1}\right\|_{\mathscr{L}\left(\boldsymbol{H}_{h} \times Q_{h}\right)} \leqslant 2\left\|\mathscr{A}_{1}^{-1}\right\|_{\mathscr{L}(\boldsymbol{H} \times Q)} \tag{4.11}
\end{equation*}
$$

Finally, from (4.4), (4.6) and (4.11) we obtain (4.1).
Since the LPS method lacks of consistency, it is important to estimate such an error in order to prove that it does not deteriorate the convergence rates. This is the subject of the next theorem.
THEOREM 4.1 Let $\left(\boldsymbol{u}_{\lambda}, p_{\lambda}\right)$ be a solution of (2.15) and assume that $\left(\boldsymbol{u}_{\lambda}, p_{\lambda}\right) \in H^{2}(\Omega)^{d} \times H^{1}(\Omega)$. Let $F_{h}$ be the mapping defined in (3.10). Then, we have the following estimate

$$
\left\|F_{h}\left(\lambda, u_{\lambda}, p_{\lambda}\right)\right\| \leqslant \operatorname{ChL}\left(1+h \lambda^{2} L^{2}\right)
$$

where $L$ is given in (4.2).
Proof. From (2.7), (2.5) and the continuous embedding $H^{2}(\Omega) \hookrightarrow L^{\infty}(\Omega)$, we get

$$
\begin{aligned}
\left\|F_{h}\left(\boldsymbol{\lambda}, \boldsymbol{u}_{\lambda}, p_{\lambda}\right)\right\| & =\sup _{\left\|\left(\boldsymbol{v}_{h}, q_{h}\right)\right\| \leqslant 1}\left(F_{h}\left(\lambda, \boldsymbol{u}_{\lambda}, p_{\lambda}\right),\left(\boldsymbol{v}_{h}, q_{h}\right)\right) \\
& =\sup _{\left\|\left(\boldsymbol{v}_{h}, q_{h}\right)\right\| \leqslant 1}\left\{\sum_{K \in \mathscr{T}_{h}}\left[\left(\chi_{h}\left(p_{\lambda}\right), \chi_{h}\left(q_{h}\right)\right)_{K}+\left(p_{e}^{K}\left(\lambda\left(\nabla \boldsymbol{u}_{\lambda}\right) \boldsymbol{u}_{\lambda}\right), p_{e}^{K}\left(\lambda\left(\nabla \boldsymbol{v}_{h}\right) \boldsymbol{u}_{\lambda}\right)\right)_{K}\right]\right\} \\
& \leqslant C \sup _{\left\|\left(\boldsymbol{v}_{h}, q_{h}\right)\right\| \leqslant 1}\left\{\sum_{K \in \mathscr{T}_{h}} h_{K}^{2}\left[\left|p_{\lambda}\right|_{1, K}\left|q_{h}\right|_{1, K}+\lambda^{2}\left\|\left(\nabla \boldsymbol{u}_{\lambda}\right) \boldsymbol{u}_{\lambda}\right\|_{0, K}\left\|\left(\nabla \boldsymbol{v}_{h}\right) \boldsymbol{u}_{\lambda}\right\|_{0, K}\right]\right\} \\
& \leqslant C \sup _{\left\|\left(\boldsymbol{v}_{h}, q_{h}\right)\right\| \leqslant 1}\left\{\sum_{K \in \mathscr{T}_{h}} h_{K}^{2}\left[\left|p_{\lambda}\right|_{1, K} h_{K}^{-1}\left\|q_{h}\right\|_{0, K}+\lambda^{2}\left\|\boldsymbol{u}_{\lambda}\right\|_{\infty, K}^{2}\left|\boldsymbol{u}_{\lambda}\right|_{1, K}\left|\boldsymbol{v}_{h}\right|_{1, K}\right]\right\} \\
& \leqslant C \sup _{\left\|\left(\boldsymbol{v}_{h}, q_{h}\right)\right\| \leqslant 1}\left\{h\left[\left|p_{\lambda}\right|_{1, \Omega}\left\|q_{h}\right\|_{0, \Omega}+\lambda^{2} h\left\|\boldsymbol{u}_{\lambda}\right\|_{\infty, \Omega}^{2}\left|\boldsymbol{u}_{\lambda}\right|_{1, \Omega}\left|\boldsymbol{v}_{h}\right|_{1, \Omega}\right]\right\} \\
& \leqslant C h L\left(1+h \lambda^{2} L^{2}\right)
\end{aligned}
$$

and the result follows.
The next result states further properties of the mapping $F_{h}$ and its derivative which will be used to prove error estimates.
Lemma 4.2 Assume the hypothesis of Lemma 4.1 hold. Therefore, there exists a constant $C$, which is independent of $h$ and $\lambda$, such that

$$
\begin{equation*}
\left\|F_{h}\left(\lambda, \mathscr{I}_{h} \boldsymbol{u}_{\lambda}, \mathscr{J}_{h} p_{\lambda}\right)\right\| \leqslant C h L\left\{2+\lambda L(1+\lambda h)^{2}(1+\lambda h L)+h \lambda^{2} L^{2}\right\} \tag{4.12}
\end{equation*}
$$

Furthermore, for each $\rho>0$ and for all $\left(\boldsymbol{v}_{h}, q_{h}\right) \in \boldsymbol{H}_{h} \times Q_{h}$ such that $\left(\boldsymbol{v}_{h}, q_{h}\right)$ belongs to the ball centered at $\left(\mathscr{I}_{h} \boldsymbol{u}_{\lambda}, \mathscr{J}_{h} p_{\lambda}\right)$ with radius $\rho$, there exists a constant $C>0$, independent of $h$ and $\lambda$ but depending on $\rho$, such that

$$
\begin{align*}
& \left\|D_{\boldsymbol{u}, p} F_{h}\left(\lambda, \mathscr{I}_{h} \boldsymbol{u}_{\lambda}, \mathscr{J}_{h} p_{\lambda}\right)-D_{\boldsymbol{u}, p} F_{h}\left(\lambda, \boldsymbol{v}_{h}, q_{h}\right)\right\|_{\mathscr{L}\left(\boldsymbol{H}_{h} \times Q_{h}\right)} \\
& \quad \leqslant C \lambda(1+\lambda h)^{2}(1+\lambda L)\left\|\left(\mathscr{I}_{h} \boldsymbol{u}_{\lambda}-\boldsymbol{v}_{h}, \mathscr{J}_{h} p_{\lambda}-q_{h}\right)\right\| . \tag{4.13}
\end{align*}
$$

Proof. From the linearity of the operator $T_{h}$ we obtain

$$
\begin{align*}
& \left\|F_{h}\left(\lambda, \mathscr{I}_{h} \boldsymbol{u}_{\lambda}, \mathscr{J}_{h} p_{\lambda}\right)\right\| \\
& \quad=\left\|F_{h}\left(\lambda, \mathscr{I}_{h} \boldsymbol{u}_{\lambda}, \mathscr{J}_{h} p_{\lambda}\right)-F_{h}\left(\lambda, \boldsymbol{u}_{\lambda}, p_{\lambda}\right)\right\|+\left\|F_{h}\left(\lambda, \boldsymbol{u}_{\lambda}, p_{\lambda}\right)\right\| \\
& \quad \leqslant\left\|\left(\mathscr{I}_{h} \boldsymbol{u}_{\lambda}-\boldsymbol{u}_{\lambda}, \mathscr{J}_{h} p_{\lambda}-p_{\lambda}\right)\right\|+\left\|T_{h}\left(G_{h}\left(\lambda, \boldsymbol{u}_{\lambda}, p_{\lambda}\right)-G_{h}\left(\lambda, \mathscr{I}_{h} \boldsymbol{u}_{\lambda}, \mathscr{J}_{h} p_{\lambda}\right)\right)\right\|+\left\|F_{h}\left(\lambda, \boldsymbol{u}_{\lambda}, p_{\lambda}\right)\right\| \\
& \quad=S_{1}+S_{2}+S_{3} . \tag{4.14}
\end{align*}
$$

To estimate $S_{1}$, we use (2.9) and (2.13) and we get

$$
\begin{equation*}
S_{1} \leqslant C h L \tag{4.15}
\end{equation*}
$$

Next, using the continuity of $T_{h}$ (see Lemma 2.4) and the definition of the dual norm, it holds

$$
\begin{aligned}
S_{2}= & \left\|T_{h}\left(G_{h}\left(\lambda, \boldsymbol{u}_{\lambda}, p_{\lambda}\right)-G_{h}\left(\lambda, \mathscr{I}_{h} \boldsymbol{u}_{\lambda}, \mathscr{J}_{h} p_{\lambda}\right)\right)\right\| \\
\leqslant & C(1+\lambda h)^{2} \sup _{\left\|\left(\boldsymbol{v}_{h}, q_{h}\right)\right\| \leqslant 1}\left(G_{h}\left(\lambda, \boldsymbol{u}_{\lambda}, p_{\lambda}\right)-G_{h}\left(\lambda, \mathscr{I}_{h} \boldsymbol{u}_{\lambda}, \mathscr{J}_{h} p_{\lambda}\right),\left(\boldsymbol{v}_{h}, q_{h}\right)\right) \\
\leqslant & C(1+\lambda h)^{2} \sup _{\left\|\left(\boldsymbol{v}_{h}, q_{h}\right)\right\| \leqslant 1}\left\{\lambda\left(\left(\nabla \boldsymbol{u}_{\lambda}\right) \boldsymbol{u}_{\lambda}-\left(\nabla \mathscr{I}_{h} \boldsymbol{u}_{\lambda}\right) \mathscr{I}_{h} \boldsymbol{u}_{\lambda}, \boldsymbol{v}_{h}\right)_{\Omega}\right. \\
& +\sum_{K \in \mathscr{T}_{h}}\left(p_{e}^{K}\left(\lambda\left(\nabla \boldsymbol{u}_{\lambda}\right) \boldsymbol{u}_{\lambda}\right), p_{e}^{K}\left(\lambda\left(\nabla \boldsymbol{v}_{h}\right) \boldsymbol{u}_{\lambda}\right)\right)_{K} \\
& \left.-\sum_{K \in \mathscr{T}_{h}}\left(p_{e}^{K}\left(\lambda\left(\nabla \mathscr{I}_{h} \boldsymbol{u}_{\lambda}\right) \mathscr{I}_{h} \boldsymbol{u}_{\lambda}\right), p_{e}^{K}\left(\lambda\left(\nabla \boldsymbol{v}_{h}\right) \mathscr{I}_{h} \boldsymbol{u}_{\lambda}\right)\right)_{K}\right\} \\
\leqslant & C(1+\lambda h)^{2} \sup _{\left\|\left(\boldsymbol{v}_{h}, q_{h}\right)\right\| \leqslant 1}\{\mathrm{I}+\mathrm{II}+\mathrm{III}\} .
\end{aligned}
$$

As for the first term on the right-hand side above, we use (4.7), (4.8) and Cauchy-Schwarz and Poincaré inequalities, to get

$$
\begin{equation*}
\mathrm{I} \leqslant C h \lambda L^{2}\left\|\left(\boldsymbol{v}_{h}, q_{h}\right)\right\| \tag{4.16}
\end{equation*}
$$

We estimate item II, through Cauchy-Schwarz's inequality, (3.2) and the continuous embedding $H^{2}(\Omega) \hookrightarrow L^{\infty}(\Omega)$ as follows

$$
\begin{align*}
\mathrm{II} & =\sum_{K \in \mathscr{T}_{h}}\left(p_{e}^{K}\left(\lambda\left(\nabla \boldsymbol{u}_{\lambda}\right) \boldsymbol{u}_{\lambda}\right), p_{e}^{K}\left(\lambda\left(\nabla \boldsymbol{v}_{h}\right) \boldsymbol{u}_{\lambda}\right)\right)_{K} \\
& \leqslant C \sum_{K \in \mathscr{T}_{h}} h_{K}^{2}\left\|\lambda\left(\nabla \boldsymbol{u}_{\lambda}\right) \boldsymbol{u}_{\lambda}\right\|_{0, K}\left\|\lambda\left(\nabla \boldsymbol{v}_{h}\right) \boldsymbol{u}_{\lambda}\right\|_{0, K} \\
& \leqslant C \sum_{K \in \mathscr{T}_{h}} \lambda^{2} h_{K}^{2}\left\|\boldsymbol{u}_{\lambda}\right\|_{\infty, K}^{2}\left|\boldsymbol{u}_{\lambda}\right|_{1, K}\left|\boldsymbol{v}_{h}\right|_{1, K} \\
& \leqslant C \lambda^{2} h^{2} L^{3}\left\|\left(\boldsymbol{v}_{h}, q_{h}\right)\right\| \tag{4.17}
\end{align*}
$$

Item III is bounded using Lemma 3.1, (4.8) and the continuous embedding $H^{2}(\Omega) \hookrightarrow L^{\infty}(\Omega)$, and (4.8)
as follows

$$
\begin{align*}
\text { III } & =\sum_{K \in \mathscr{I}_{h}}\left(p_{e}^{K}\left(\lambda\left(\nabla \mathscr{I}_{h} \boldsymbol{u}_{\lambda}\right) \mathscr{I}_{h} \boldsymbol{u}_{\lambda}\right), p_{e}^{K}\left(\lambda\left(\nabla \boldsymbol{v}_{h}\right) \mathscr{\mathscr { h }}_{h} \boldsymbol{u}_{\lambda}\right)\right)_{K} \\
& \leqslant C \sum_{K \in \mathscr{S}_{h}} h_{K}^{2}\left\|\lambda\left(\nabla \mathscr{I}_{h} \boldsymbol{u}_{\lambda}\right) \mathscr{I}_{h} \boldsymbol{u}_{\lambda}\right\|_{0, K}\left\|\lambda\left(\nabla \boldsymbol{v}_{h}\right) \mathscr{I}_{h} \boldsymbol{u}_{\lambda}\right\|_{0, K} \\
& \leqslant C \sum_{K \in \mathscr{\mathscr { F }}_{h}} \lambda^{2} h_{K}^{2} L\left\|\boldsymbol{u}_{\lambda}\right\|_{2, K}\left|\boldsymbol{v}_{h}\right|_{1, K}\left\|\mathscr{I}_{h} \boldsymbol{u}_{\lambda}\right\|_{\infty, K} \\
& \leqslant C \sum_{K \in \mathscr{S}_{h}} \lambda^{2} h_{K}^{2} L\left\|\boldsymbol{u}_{\lambda}\right\|_{2, K}\left|\boldsymbol{v}_{h}\right|_{1, K}\left\|\boldsymbol{u}_{\lambda}\right\|_{\infty, K} \\
& \leqslant C \lambda^{2} h^{2} L^{3}\left\|\left(\boldsymbol{v}_{h}, q_{h}\right)\right\| . \tag{4.18}
\end{align*}
$$

Now, gathering (4.16)-(4.18) together, we obtain the following estimate

$$
\begin{equation*}
S_{2} \leqslant C h(1+\lambda h)^{2}(1+\lambda h L) \lambda L^{2}, \tag{4.19}
\end{equation*}
$$

and from (4.14) and (4.15), (4.19), and Theorem 4.1 result (4.12) follows. Estimate (4.13) is addressed next. Let $\left(\boldsymbol{u}_{h}, p_{h}\right),\left(\boldsymbol{v}_{h}, q_{h}\right),\left(\boldsymbol{w}_{h}, r_{h}\right) \in \boldsymbol{H}_{h} \times Q_{h}$ with $\left\|\left(\boldsymbol{w}_{h}, r_{h}\right)\right\|=1$. From the stability of the discrete Stokes operator in Lemma 2.4, we get

$$
\begin{aligned}
& \left\|D_{\boldsymbol{u}, p} F_{h}\left(\lambda, \boldsymbol{v}_{h}, q_{h}\right)\left(\boldsymbol{w}_{h}, r_{h}\right)-D_{\boldsymbol{u}, p} F_{h}\left(\lambda, \mathscr{I}_{h} \boldsymbol{u}_{\lambda}, \mathscr{J}_{h} p_{\lambda}\right)\left(\boldsymbol{w}_{h}, r_{h}\right)\right\| \\
& =\left\|T_{h}\left(D_{\boldsymbol{u}, p} G_{h}\left(\lambda, \boldsymbol{v}_{h}, q_{h}\right)\left(\boldsymbol{w}_{h}, r_{h}\right)-D_{\boldsymbol{u}, p} G_{h}\left(\lambda, \mathscr{I}_{h} \boldsymbol{u}_{\lambda}, \mathscr{J}_{h} p_{\lambda}\right)\left(\boldsymbol{w}_{h}, r_{h}\right)\right)\right\| \\
& \leqslant C(1+\lambda h)^{2} \sup _{\left\|\left(z_{h}, s_{h}\right)\right\| \leqslant 1}\left(D_{\boldsymbol{u}, p} G_{h}\left(\lambda, \boldsymbol{v}_{h}, q_{h}\right)\left(\boldsymbol{w}_{h}, r_{h}\right)-D_{\boldsymbol{u}, p} G_{h}\left(\lambda, \mathscr{I}_{h} \boldsymbol{u}_{\lambda}, \mathscr{J}_{h} p_{\lambda}\right)\left(\boldsymbol{w}_{h}, r_{h}\right),\left(\boldsymbol{z}_{h}, s_{h}\right)\right) \\
& \leqslant C(1+\lambda h)^{2} \sup _{\left\|\left(z_{h}, s_{h}\right)\right\| \leqslant 1}\left\{\left(\lambda \nabla\left(\mathscr{I}_{h} \boldsymbol{u}_{\lambda}-\boldsymbol{v}_{h}\right) \boldsymbol{w}_{h}-\lambda\left(\nabla \boldsymbol{w}_{h}\right)\left(\mathscr{I}_{h} \boldsymbol{u}_{\lambda}-\boldsymbol{v}_{h}\right), z_{h}\right)\right. \\
& +\sum_{K \in \mathscr{\mathscr { K }}_{h}}\left(p_{e}^{K}\left(\lambda\left(\nabla \boldsymbol{v}_{h}\right) \boldsymbol{v}_{h}-\lambda\left(\nabla \mathscr{I}_{h} \boldsymbol{u}_{\lambda}\right) \mathscr{I}_{h} \boldsymbol{u}_{\lambda}\right), p_{e}^{K}\left(\lambda\left(\nabla \boldsymbol{z}_{h}\right) \boldsymbol{w}_{h}\right)\right)_{K} \\
& -\sum_{K \in \mathscr{F}_{h}}\left(p_{e}^{K}\left(\lambda\left(\nabla \mathscr{I}_{h} \boldsymbol{u}_{\lambda}\right) \boldsymbol{w}_{h}+\lambda\left(\nabla \boldsymbol{w}_{h}\right) \mathscr{I}_{h} \boldsymbol{u}_{\lambda}\right), p_{e}^{K}\left(\lambda\left(\nabla \boldsymbol{z}_{h}\right) \mathscr{I}_{h} \boldsymbol{u}_{\lambda}\right)\right)_{K} \\
& +\sum_{K \in \mathscr{C}_{h}}\left(p_{e}^{K}\left(\lambda\left(\nabla \boldsymbol{v}_{h}\right) \boldsymbol{w}_{h}+\lambda\left(\nabla \boldsymbol{w}_{h}\right) \boldsymbol{v}_{h}\right), p_{e}^{K}\left(\lambda\left(\nabla \boldsymbol{z}_{h}\right) \boldsymbol{v}_{h}\right)\right)_{K} \\
& =C(1+\lambda h)^{2} \sup _{\left\|\left(z_{h}, s_{h}\right)\right\| \leqslant 1}\{\mathrm{IV}+\mathrm{V}+\mathrm{VI}+\mathrm{VII}\} .
\end{aligned}
$$

We bound IV using (2.3) as follows

$$
\begin{equation*}
\text { IV } \leqslant 2 \alpha \lambda\left\|\left(\mathscr{I}_{h} \boldsymbol{u}_{\lambda}-\boldsymbol{v}_{h}, \mathscr{J}_{h} p_{\lambda}-q_{h}\right)\right\|\| \|\left(\boldsymbol{w}_{h}, r_{h}\right)\| \|\left\|\left(z_{h}, s_{h}\right)\right\| . \tag{4.20}
\end{equation*}
$$

We address item V now. To this end, we use Lemma 3.1, (2.5) with $l=1, m=0$ and $p=q=4$, the embedding $H^{1}(\Omega) \hookrightarrow L^{4}(\Omega)$, Hölder, Cauchy-Schwarz and Poincaré inequalities and the definition of
the norm $\|\mid \cdot\|$, to obtain

$$
\begin{align*}
& \mathrm{V}=-\sum_{K \in \mathscr{T}_{h}} \lambda\left(p_{e}^{K}\left(\left(\nabla \mathscr{I}_{h} \boldsymbol{u}_{\lambda}\right) \mathscr{I}_{h} \boldsymbol{u}_{\lambda}-\left(\nabla \boldsymbol{v}_{h}\right) \boldsymbol{v}_{h}\right), p_{e}^{K}\left(\boldsymbol{\lambda}\left(\nabla \boldsymbol{z}_{h}\right) \boldsymbol{w}_{h}\right)\right)_{K} \\
& \leqslant C \lambda^{2} \sum_{K \in \mathscr{T}_{h}} h_{K}^{2}\left\|\left(\nabla \mathscr{I}_{h} \boldsymbol{u}_{\lambda}\right) \mathscr{I}_{h} \boldsymbol{u}_{\lambda}-\left(\nabla \boldsymbol{v}_{h}\right) \boldsymbol{v}_{h}\right\|_{0, K}\left\|\left(\nabla \boldsymbol{z}_{h}\right) \boldsymbol{w}_{h}\right\|_{0, K} \\
& \leqslant C \lambda^{2} \sum_{K \in \mathscr{T}_{h}} h_{K}^{2}\left\|\left(\nabla \mathscr{I}_{h} \boldsymbol{u}_{\lambda}\right) \mathscr{I}_{h} \boldsymbol{u}_{\lambda}-\left(\nabla \boldsymbol{v}_{h}\right) \boldsymbol{v}_{h}\right\|_{0, K}\left|z_{h}\right|_{1,4, K}\left\|\boldsymbol{w}_{h}\right\|_{0,4, K} \\
& \leqslant C \lambda^{2} \sum_{K \in \mathscr{T}_{h}} h_{K}^{2}\left\{\left\|\left(\nabla \mathscr{I}_{h} \boldsymbol{u}_{\lambda}\right)\left(\mathscr{I}_{h} \boldsymbol{u}_{\lambda}-\boldsymbol{v}_{h}\right)\right\|_{0, K}+\left\|\left(\nabla\left(\mathscr{I}_{h} \boldsymbol{u}_{\lambda}-\boldsymbol{v}_{h}\right)\right) \boldsymbol{v}_{h}\right\|_{0, K}\right\} h_{K}^{-1}\left\|z_{h}\right\|_{0,4, K}\left\|\boldsymbol{w}_{h}\right\|_{0,4, K} \\
& \leqslant C \lambda^{2} \sum_{K \in \mathscr{T}_{h}} h_{K}^{2}\left\{\left\|\nabla \mathscr{I}_{h} \boldsymbol{u}_{\lambda}\right\|_{0,4, K}\left\|\mathscr{I}_{h} \boldsymbol{u}_{\lambda}-\boldsymbol{v}_{h}\right\|_{0,4, K}+\left\|\nabla\left(\mathscr{I}_{h} \boldsymbol{u}_{\lambda}-\boldsymbol{v}_{h}\right)\right\|_{0,4, K}\left\|\boldsymbol{v}_{h}\right\|_{0,4, K}\right\} h_{K}^{-1}\left\|z_{h}\right\|_{0,4, K}\left\|\boldsymbol{w}_{h}\right\|_{0,4, K} \\
& \leqslant C \lambda^{2} \sum_{K \in \mathscr{T}_{h}} h_{K}^{2}\left\{h_{K}^{-1}\left\|\mathscr{I}_{h} \boldsymbol{u}_{\lambda}\right\|_{0,4, K}\left\|\mathscr{I}_{h} \boldsymbol{u}_{\lambda}-\boldsymbol{v}_{h}\right\|_{0,4, K}+h_{K}^{-1}\left\|\mathscr{I}_{h} \boldsymbol{u}_{\lambda}-\boldsymbol{v}_{h}\right\|_{0,4, K}\left\|\boldsymbol{v}_{h}\right\|_{0,4, K}\right\} h_{K}^{-1}\left\|\boldsymbol{z}_{h}\right\|_{0,4, K}\left\|\boldsymbol{w}_{h}\right\|_{0,4, K} \\
& \leqslant C \lambda^{2}\left\{\left\|\mathscr{I}_{h} \boldsymbol{u}_{\lambda}\right\|_{0,4, \Omega}+\left\|\boldsymbol{v}_{h}\right\|_{0,4, \Omega}\right\}\left\|\mathscr{I}_{h} \boldsymbol{u}_{\lambda}-\boldsymbol{v}_{h}\right\|_{0,4, \Omega}\left\|z_{h}\right\|_{0,4, \Omega}\left\|\boldsymbol{w}_{h}\right\|_{0,4, \Omega} \\
& \leqslant C \lambda^{2}\left\{\left\|\mathscr{I}_{h} \boldsymbol{u}_{\lambda}\right\|_{1, \Omega}+\left\|\boldsymbol{v}_{h}\right\|_{1, \Omega}\right\}\left\|\mathscr{I}_{h} \boldsymbol{u}_{\lambda}-\boldsymbol{v}_{h}\right\|_{1, \Omega}\left\|z_{h}\right\|_{1, \Omega}\left\|\boldsymbol{w}_{h}\right\|_{1, \Omega} \\
& \leqslant C \lambda^{2}\{L+\rho\}\left\|\left(\mathscr{I}_{h} \boldsymbol{u}_{\lambda}-\boldsymbol{v}_{h}, \mathscr{J}_{h} p_{\lambda}-q_{h}\right)\right\|\| \|\left(\boldsymbol{w}_{h}, r_{h}\right)\| \|\left\|\left(z_{h}, s_{h}\right)\right\| \tag{4.21}
\end{align*}
$$

We follow closely the same arguments to estimate items VI and VII, and we get

$$
\begin{align*}
\mathrm{VI} & =-\sum_{K \in \mathscr{T}_{h}} \lambda\left(p_{e}^{K}\left(\left(\nabla\left(\mathscr{I}_{h} \boldsymbol{u}_{\lambda}-\boldsymbol{v}_{h}\right)\right) \boldsymbol{w}_{h}+\left(\nabla \boldsymbol{w}_{h}\right)\left(\mathscr{I}_{h} \boldsymbol{u}_{\lambda}-\boldsymbol{v}_{h}\right)\right), p_{e}^{K}\left(\lambda\left(\nabla \boldsymbol{z}_{h}\right) \mathscr{I}_{h} \boldsymbol{u}_{\lambda}\right)\right)_{K} \\
& \leqslant C \lambda^{2} \sum_{K \in \mathscr{T}_{h}} h_{K}^{2}\left\|\left(\nabla\left(\mathscr{I}_{h} \boldsymbol{u}_{\lambda}-\boldsymbol{v}_{h}\right)\right) \boldsymbol{w}_{h}+\left(\nabla \boldsymbol{w}_{h}\right)\left(\mathscr{I}_{h} \boldsymbol{u}_{\lambda}-\boldsymbol{v}_{h}\right)\right\|_{0, K}\left\|\left(\nabla \boldsymbol{z}_{h}\right) \mathscr{I}_{h} \boldsymbol{u}_{\lambda}\right\|_{0, K} \\
& \leqslant C \lambda^{2} \sum_{K \in \mathscr{T}_{h}} h_{K}^{2}\left\{\left\|\nabla\left(\mathscr{I}_{h} \boldsymbol{u}_{\lambda}-\boldsymbol{v}_{h}\right)\right\|_{0,4, K}\left\|\boldsymbol{w}_{h}\right\|_{0,4, K}+\left\|\nabla \boldsymbol{w}_{h}\right\|_{0,4, K}\left\|\mathscr{I}_{h} \boldsymbol{u}_{\lambda}-\boldsymbol{v}_{h}\right\|_{0,4, K}\right\}\left\|\nabla \boldsymbol{z}_{h}\right\|_{0,4, K}\left\|\mathscr{I}_{h} \boldsymbol{u}_{\lambda}\right\|_{0,4, K} \\
& \leqslant C \lambda^{2} L\left\|\left(\mathscr{I}_{h} \boldsymbol{u}_{\lambda}-\boldsymbol{v}_{h}, \mathscr{J}_{h} p_{\lambda}-q_{h}\right)\right\|\| \|\left(\boldsymbol{w}_{h}, r_{h}\right)\| \|\left\|\left(\boldsymbol{z}_{h}, s_{h}\right)\right\| \tag{4.22}
\end{align*}
$$

and

$$
\begin{align*}
\mathrm{VII} & =-\sum_{K \in \mathscr{T}} \lambda\left(p_{e}^{K}\left(\left(\nabla \boldsymbol{v}_{h}\right) \boldsymbol{w}_{h}+\left(\nabla \boldsymbol{w}_{h}\right) \boldsymbol{v}_{h}\right), p_{e}^{K}\left(\boldsymbol{\lambda}\left(\nabla \boldsymbol{z}_{h}\right)\left(\mathscr{I}_{h} \boldsymbol{u}_{\lambda}-\boldsymbol{v}_{h}\right)\right)\right)_{K} \\
& \leqslant C \lambda^{2} \sum_{K \in \mathscr{T}_{h}} h_{K}^{2}\left\|\left(\nabla \boldsymbol{v}_{h}\right) \boldsymbol{w}_{h}+\left(\nabla \boldsymbol{w}_{h}\right) \boldsymbol{v}_{h}\right\|_{0, K}\left\|\left(\nabla \boldsymbol{z}_{h}\right)\left(\mathscr{I}_{h} \boldsymbol{u}_{\lambda}-\boldsymbol{v}_{h}\right)\right\|_{0, K} \\
& \leqslant C \lambda^{2} \sum_{K \in \mathscr{T}_{h}} h_{K}^{2}\left\{\left\|\nabla \boldsymbol{v}_{h}\right\|_{0,4, K}\left\|\boldsymbol{w}_{h}\right\|_{0,4, K}+\left\|\nabla \boldsymbol{w}_{h}\right\|_{0,4, K}\left\|\boldsymbol{v}_{h}\right\|_{0,4, K}\right\}\left\|z_{h}\right\|_{0,4, K}\left\|\mathscr{I}_{h} \boldsymbol{u}_{\lambda}-\boldsymbol{v}_{h}\right\|_{0,4, K} \\
& \leqslant C \lambda^{2} \boldsymbol{\rho}\left\|\left(\mathscr{I}_{h} \boldsymbol{u}_{\lambda}-\boldsymbol{v}_{h}, \mathscr{J}_{h} p_{\lambda}-q_{h}\right)\right\|\| \|\left(\boldsymbol{w}_{h}, r_{h}\right)\| \|\left\|\left(z_{h}, s_{h}\right)\right\| \tag{4.23}
\end{align*}
$$

Estimate (4.13) results from (4.20)-(4.23).
We are now ready to prove the existence and uniqueness of a branch of discrete solutions as well as the error estimate.

THEOREM 4.2 Assume the hypothesis of Lemma 4.1 hold. Therefore, there exists a positive constant $h_{0}(\Lambda)$, such that for all $h$ with $0<h \leqslant h_{0}$, a unique branch $\lambda \rightarrow\left(\boldsymbol{u}_{h, \lambda}, p_{h, \lambda}\right)$ of solutions of problem
(3.10) exists in a neighborhood of $\left(\boldsymbol{u}_{\lambda}, p_{\lambda}\right)$. Moreover, the following estimate holds

$$
\sup _{\lambda \in \Lambda}\left\{\left|\boldsymbol{u}_{\lambda}-\boldsymbol{u}_{h, \lambda}\right|_{1, \Omega}^{2}+\left\|p_{\lambda}-p_{h, \lambda}\right\|_{0, \Omega}^{2}\right\}^{1 / 2} \leqslant C h
$$

where $C=C(L, \Lambda)>0$ does not depend on $h$.
Proof. As a result of Lemma 4.1, the differential operator $D_{\boldsymbol{u}, p} F_{h}\left(\lambda, \mathscr{I}_{h} \boldsymbol{u}_{\lambda}, \mathscr{J}_{h} p_{\lambda}\right)$ is an isomorphism of $\boldsymbol{H}_{h} \times Q_{h}$ onto itself for each $\lambda \in \Lambda$, provided that $h \sup _{\lambda \in \Lambda} \lambda$ is sufficiently small. Now, let $\Phi$ : $\boldsymbol{H}_{h} \times Q_{h} \rightarrow \boldsymbol{H}_{h} \times Q_{h}$ be the application defined by

$$
\Phi\left(\boldsymbol{u}_{h}, p_{h}\right):=\left(\boldsymbol{u}_{h}, p_{h}\right)+D_{\boldsymbol{u}, p} F_{h}\left(\lambda, \mathscr{I}_{h} \boldsymbol{u}_{\lambda}, \mathscr{J}_{h} p_{\lambda}\right)^{-1} F_{h}\left(\lambda, \boldsymbol{u}_{h}, p_{h}\right) \quad \forall\left(\boldsymbol{u}_{h}, p_{h}\right) \in \boldsymbol{H}_{h} \times Q_{h}
$$

Observe that (3.10) may be rewritten as a fixed point problem with respect to the operator $\Phi$. Next, let $\left(\boldsymbol{u}_{h}, p_{h}\right),\left(\boldsymbol{v}_{h}, q_{h}\right) \in B\left(\left(\mathscr{I}_{h} \boldsymbol{u}_{\lambda}, \mathscr{J}_{h} p_{\lambda}\right), \rho\right)$, where $\rho$ will be fixed in the sequel. From Lemma 4.2 we get

$$
\begin{aligned}
& \left\|\Phi\left(\boldsymbol{u}_{h}, p_{h}\right)-\Phi\left(\boldsymbol{v}_{h}, q_{h}\right)\right\| \leqslant\left\|\left\{D_{\boldsymbol{u}, p} F_{h}\left(\lambda, \mathscr{I}_{h} \boldsymbol{u}_{\lambda}, \mathscr{J}_{h} p_{\lambda}\right)\right\}^{-1}\right\| \mathscr{L}^{\left(\boldsymbol{H}_{h} \times Q_{h}\right)} \\
& \left\|F_{h}\left(\lambda, \boldsymbol{u}_{h}, p_{h}\right)-F_{h}\left(\lambda, \boldsymbol{v}_{h}, q_{h}\right)-D_{\boldsymbol{u}, p} F_{h}\left(\lambda, \mathscr{I}_{h} \boldsymbol{u}_{\lambda}, \mathscr{J}_{h} p_{\lambda}\right)\left[\left(\boldsymbol{u}_{h}, p_{h}\right)-\left(\boldsymbol{v}_{h}, q_{h}\right)\right]\right\| \\
\leqslant & \left\|\left\{D_{\boldsymbol{u}, p} F_{h}\left(\lambda, \mathscr{I}_{h} \boldsymbol{u}_{\lambda}, \mathscr{J}_{h} p_{\lambda}\right)\right\}^{-1}\right\|_{\mathscr{L}\left(\boldsymbol{H}_{h} \times Q_{h}\right)}\| \| \int_{0}^{1}\left\{D_{\boldsymbol{u}, p} F_{h}\left(\lambda, \mathscr{I}_{h} \boldsymbol{u}_{\lambda}, \mathscr{J}_{h} p_{\lambda}\right)\right. \\
& \left.-D_{\boldsymbol{u}, p} F_{h}\left(\lambda, \boldsymbol{u}_{h}+\boldsymbol{\theta}\left(\boldsymbol{v}_{h}-\boldsymbol{u}_{h}\right), p_{h}+\boldsymbol{\theta}\left(q_{h}-p_{h}\right)\right)\right\}\left[\left(\boldsymbol{u}_{h}, p_{h}\right)-\left(\boldsymbol{v}_{h}, q_{h}\right)\right] d \theta \| \\
\leqslant & \left.C \lambda(1+\lambda h)^{2}(1+\lambda L) \rho\left\|\left\{D_{\boldsymbol{u}, p} F_{h}\left(\lambda, \mathscr{I}_{h} \boldsymbol{u}_{\lambda}, \mathscr{J}_{h} p_{\lambda}\right)\right\}^{-1}\right\|_{\mathscr{L}\left(\boldsymbol{H}_{h} \times Q_{h}\right)}\left\|\left(\boldsymbol{u}_{h}, p_{h}\right)-\left(\boldsymbol{v}_{h}, q_{h}\right)\right\| 4.24\right)
\end{aligned}
$$

We are ready to fix parameter $\rho$, which is defined as follows

$$
\rho:=\left\|\left\{D_{\boldsymbol{u}, p} F\left(\lambda, \boldsymbol{u}_{\lambda}, p_{\lambda}\right)\right\}^{-1}\right\|_{\mathscr{L}(\boldsymbol{H} \times Q)}^{-1}\left\|F_{h}\left(\lambda, \mathscr{I}_{h} \boldsymbol{u}_{\lambda}, \mathscr{J}_{h} p_{\lambda}\right)\right\|
$$

Next, replacing it in (4.24), and using lemmas 4.1 and 4.2, we arrive at

$$
\begin{equation*}
\left\|\Phi\left(\boldsymbol{u}_{h}, p_{h}\right)-\boldsymbol{\Phi}\left(\boldsymbol{v}_{h}, q_{h}\right)\right\|\|\leqslant C(L, \Lambda) h\| \mid\left(\boldsymbol{u}_{h}, p_{h}\right)-\left(\boldsymbol{v}_{h}, q_{h}\right) \| . \tag{4.25}
\end{equation*}
$$

As a result, picking $h$ small enough, $\Phi$ becomes a contraction from $B\left(\left(\mathscr{I}_{h} \boldsymbol{u}_{\lambda}, \mathscr{J}_{h} p_{\lambda}\right), \rho\right)$ onto itself, and we conclude that for $\lambda \in \Lambda$ fix, problem (3.10) has a unique solution $\left(\boldsymbol{u}_{h, \lambda}, p_{h, \lambda}\right) \in B\left(\left(\mathscr{I}_{h} \boldsymbol{u}_{\lambda}, \mathscr{J}_{h} p_{\lambda}\right) ; \rho\right)$. The error estimate follows using the triangle inequality

$$
\left\|\left\|\left(\boldsymbol{u}_{\lambda}-\boldsymbol{u}_{h, \lambda}, p_{\lambda}-p_{h, \lambda}\right)\right\| \leqslant\right\|\left(\boldsymbol{u}_{\lambda}-\mathscr{I}_{h} \boldsymbol{u}_{\lambda}, p_{\lambda}-\mathscr{J}_{h} p_{\lambda}\right)\|+\|\left(\mathscr{I}_{h} \boldsymbol{u}_{\lambda}-\boldsymbol{u}_{h, \lambda}, \mathscr{J}_{h} p_{\lambda}-p_{h, \lambda}\right) \|,
$$

and the fact that $\left(\boldsymbol{u}_{h, \lambda}, p_{h, \lambda}\right) \in B\left(\left(\mathscr{I}_{h} \boldsymbol{u}_{\lambda}, \mathscr{J}_{h} p_{\lambda}\right) ; \rho\right)$ with $\rho \leqslant C(L, \Lambda) h$, and (2.9)-(2.14).

## 5. Numerical validation

The exact solution of local problem (3.1) is (in general) not available, and then, method (3.3) requests a two-level discretization strategy. Nevertheless, an one-level version of method (3.3) can be proposed and still preserves the overall properties of the original two-level method. To see this more clearly, notice first that for a given function $v=\nabla q \in L^{2}(K)^{d}$, the solution of problem (3.1) reads

$$
\begin{equation*}
\boldsymbol{u}_{e}^{K}(\nabla q)=\mathbf{0} \quad \text { and } \quad p_{e}^{K}(\nabla q)=\chi_{h}(q) \tag{5.1}
\end{equation*}
$$

Also, observe that from (5.1), we can get the following closed formula

$$
\begin{align*}
p_{e}^{K}\left(\Pi_{K}\left(\left(\nabla \boldsymbol{u}_{h}\right) \boldsymbol{u}_{h}\right)\right) & =\chi_{h}\left(\boldsymbol{x} \cdot\left(\nabla \boldsymbol{u}_{h}\right) \Pi_{K} \boldsymbol{u}_{h}\right),  \tag{5.2}\\
p_{e}^{K}\left(\Pi_{K}\left(\left(\nabla \boldsymbol{v}_{h}\right) \boldsymbol{u}_{h}\right)\right) & =\chi_{h}\left(\boldsymbol{x} \cdot\left(\nabla \boldsymbol{v}_{h}\right) \Pi_{K} \boldsymbol{u}_{h}\right) . \tag{5.3}
\end{align*}
$$

As a result, we can simplify (3.3) by replacing $p_{e}^{K}\left(\left(\nabla \boldsymbol{u}_{h}\right) \boldsymbol{u}_{h}\right)$ by $p_{e}^{K}\left(\Pi_{K}\left(\left(\nabla \boldsymbol{u}_{h}\right) \boldsymbol{u}_{h}\right)\right)$, and $p_{e}^{K}\left(\left(\nabla \boldsymbol{v}_{h}\right) \boldsymbol{u}_{h}\right)$ by $p_{e}^{K}\left(\Pi_{K}\left(\left(\nabla \boldsymbol{v}_{h}\right) \boldsymbol{u}_{h}\right)\right)$, and using the (5.2) and (5.3) in method (3.3). The result is an one-level LPS method which reads: Find $\left(\boldsymbol{u}_{h}, \tilde{p}_{h}\right) \in \boldsymbol{H}_{h} \times Q_{h}$ such that

$$
\begin{align*}
& \boldsymbol{v}\left(\nabla \boldsymbol{u}_{h}, \nabla \boldsymbol{v}_{h}\right)+\left(\left(\nabla \boldsymbol{u}_{h}\right) \boldsymbol{u}_{h}, \boldsymbol{v}_{h}\right)-\left(\tilde{p}_{h}, \nabla \cdot \boldsymbol{v}_{h}\right)+\left(\tilde{q}_{h}, \nabla \cdot \boldsymbol{u}_{h}\right) \\
& +\sum_{K \in \mathscr{T}} \frac{\alpha_{K}}{v}\left[\left(\chi_{h}\left(\tilde{p}_{h}\right), \chi_{h}\left(\tilde{q}_{h}\right)\right)_{K}+\left(\chi_{h}\left(\boldsymbol{x} \cdot\left(\nabla \boldsymbol{u}_{h}\right) \Pi_{K} \boldsymbol{u}_{h}\right), \chi_{h}\left(\boldsymbol{x} \cdot\left(\nabla \boldsymbol{v}_{h}\right) \Pi_{K} \boldsymbol{u}_{h}\right)\right)_{K}\right] \\
& +\sum_{K \in \mathscr{T}_{h}} \frac{\gamma_{K}}{v}\left(\chi_{h}\left(\boldsymbol{x} \nabla \cdot \boldsymbol{u}_{h}\right), \chi_{h}\left(\boldsymbol{x} \nabla \cdot \boldsymbol{v}_{h}\right)\right)_{K}+\sum_{F \in \mathscr{E}_{h}} \tau_{F}\left(\llbracket \tilde{p}_{h} \rrbracket, \llbracket \tilde{q}_{h} \rrbracket\right)_{F}=\left(\tilde{\boldsymbol{f}}, \boldsymbol{v}_{h}\right) . \tag{5.4}
\end{align*}
$$

REMARK 5.1 One-level method (5.4) is more suitable to be implemented than the original LPS method (3.3) as the former avoids two-level computations. As such, version (5.4) will be adopted to perform numerical validations. Notice that the theoretical results developed for method (3.3) remains valid since the operator $p_{e}^{K} \circ \Pi_{K}$ shares the same property as the operator $p_{e}^{K}$ (see the stability result in Lemma 3.1, for instance). This is a simple consequence of the $L^{2}$ stability of the projection operator $\Pi_{K}$. Consequently, overall theoretical results can be extended, with minor differences, to the simplified LPS method (5.4).

Next, numerical experiments validate the LPS method. We focus on three-dimensional test cases since similar conclusions may be also obtained from the two-dimensional tests. We first propose an analytical numerical test from which theoretical convergence results are validated. Then, we address numerical comparisons with some well-documented benchmarks from the literature.

### 5.1 Analytic solution

In this case $\Omega:=] 0,1\left[3, v=1,10^{-2}\right.$. The right hand-side $\tilde{f}$ is chosen such that the solution of the problem is given by

$$
\boldsymbol{u}(x, y, z)=\left(e^{x} \sin z,-e^{x} \sin z, e^{x} \cos z-e^{x} \cos y\right) \quad \text { and } \quad p(x, y, z)=-\frac{1}{2} e^{2 x}+\frac{1}{4}\left(e^{2}-1\right)
$$

Figures 1-4 highlight the convergence rates for the finite elements $\mathbb{P}_{1} \times \mathbb{P}_{1}$ (with continuos pressure) and $\mathbb{P}_{1} \times \mathbb{P}_{0}$. We observe a perfect agreement with the theoretical results.

FIG. 1. Convergence history for the $\mathbb{P}_{1} \times \mathbb{P}_{1}$ scheme $(v=1)$.

FIG. 2. Convergence history for the $\mathbb{P}_{1} \times \mathbb{P}_{0}$ scheme $(v=1)$.

Fig. 3. Convergence history for the $\mathbb{P}_{1} \times \mathbb{P}_{1}$ scheme $\left(v=10^{-2}\right)$.

FIG. 4. Convergence history for the $\mathbb{P}_{1} \times \mathbb{P}_{0}$ scheme $\left(v=10^{-2}\right)$.

### 5.2 3D Lid-driven cavity problem

We consider the rectangular cavity depicted in Figure 5 with the Dirichlet boundary conditions shown also in Figure 5. The Reynolds's number $\left(\operatorname{Re}:=\frac{1}{v}\right)$ is set to $R e=1500$.

FIG. 5. Boundary conditions for the 3D lid-driven cavity.

Figures 6 and 9 show the trajectory of some particles released from $(0.5,1.9,0.03)$ and $(0.188,1.567,0.0708)$ and computed using the LPS method with the finite elements $\mathbb{P}_{1} \times \mathbb{P}_{1}$ (continuos pressure) and $\mathbb{P}_{1} \times \mathbb{P}_{0}$. We note that we recover the swirling paths which is characteristic of the three-dimensional flow (see Shankar \& Deshpande (2000) and Chiang et al. (1996), for instance).

FIG. 6. Trajectory of particles released at $(0.5,1.9,0.03)$ (left) and at $(0.188,1.567,0.0708)$ (right) using the $\mathbb{P}_{1} \times \mathbb{P}_{1}$ element. Here we picture only a half of the cavity.

Next, we depict in Figures 7 and 10 the streamlines on three different plane sections (set at inflow, at the middle and at the outflow of the domain) obtained using the finite elements $\mathbb{P}_{1} \times \mathbb{P}_{1}$ and $\mathbb{P}_{1} \times \mathbb{P}_{0}$. We observe a qualitative agreement with the results presented in Shankar \& Deshpande (2000) and Chiang et al. (1996).

FIG. 7. Streamlines at different cross-sections using the finite element $\mathbb{P}_{1} \times \mathbb{P}_{1}$.

Figures 8 and 11 shows the isosurfaces of the magnitude of the velocity field with value equal to 0.13 , and the isosurfaces of the vorticity magnitude with value equal to 1 . Such results are obtained using the finite elements $\mathbb{P}_{1} \times \mathbb{P}_{1}$ and $\mathbb{P}_{1} \times \mathbb{P}_{0}$. We observe the primary vortex within the cavity as expected, which turns to be qualitatively similar to the one presented in Ravnik et al. (2009).

FIG. 8. Isosurface of $|\boldsymbol{u}|=0.13$ (left) and isosurface of $|\nabla \times \boldsymbol{u}|=1$ (right) with the $\mathbb{P}_{1} \times \mathbb{P}_{1}$ element.

FIG. 9. Trajectory of particles released at $(0.5,1.9,0.03)$ (left) and at $(0.188,1.567,0.0708)$ (right) using the $\mathbb{P}_{1} \times \mathbb{P}_{0}$ element. Here we picture only a half of the cavity.

FIG. 10. Streamlines at different cross-sections using the finite element $\mathbb{P}_{1} \times \mathbb{P}_{0}$.

FIG. 11. Isosurface of $|\boldsymbol{u}|=0.13$ (left) and isosurface of $|\nabla \times \boldsymbol{u}|=1$ (right) with the $\mathbb{P}_{1} \times \mathbb{P}_{1}$ element.

### 5.3 The circular cylinder problem

The statement of the problem is shown in Figure 12. The inflow velocity field is $\boldsymbol{u}_{p}=(7.2 y z(0.41-$ $\left.y)(0.41-z) / 0.41^{4}, 0,0\right)^{T}$ and $v=10^{-3}$ (for further details, see Turek (1999)).

FIG. 12. Domain and boundary conditions for the flow problem around a cylinder with circular cross-section.

We validate our numerical results using the drag and the lift coefficients defined as follows

$$
C_{D}:=\frac{2}{\bar{u}^{2} D 0.41} \int_{S}\left(v \frac{\partial v_{t}}{\partial \boldsymbol{n}} n_{y}-p n_{x}\right) d S, \quad C_{L}:=-\frac{2}{\bar{u}^{2} D 0.41} \int_{S}\left(v \frac{\partial \boldsymbol{v}_{t}}{\partial \boldsymbol{n}} n_{x}+p n_{y}\right) d S
$$

Here $S$ is the boundary of the cylinder, $\boldsymbol{n}:=\left(n_{x}, n_{y}, n_{z}\right)$ is the outward normal vector on $S, \boldsymbol{v}_{t}$ is the tangential component of the velocity on $S$ and $t$ is one of the tangent vectors on $S$. We set $D$, the cylinder diameter, to 0.1 and $\bar{u}$, the mean velocity, to $\frac{4}{9} u_{p}(0,0.205,0.205)$. Finally, we denote the difference of pressure between two points by

$$
\Delta p:=p\left(x_{a}, y_{a}, z_{a}\right)-p\left(x_{e}, y_{e}, z_{e}\right),
$$

and we evaluate it at the points $\left(x_{a}, y_{a}, z_{a}\right)=(0.45,0.2,0.205)$ and $\left(x_{e}, y_{e}, z_{e}\right)=(0.55,0.2,0.205)$.
In Table 1 we compare the results from the LPS method with the ones obtained from other approaches in the literature. We see that the results remain at the same range of values (despite the differences at the order of approximation among the methods).

| Scheme | $C_{D}$ | $C_{L}$ | $\Delta p$ |
| :--- | :---: | :---: | :---: |
| Schäfer et. al. Schäfer \& Turek (1996) | 6.1295 | 0.0093 | 0.1693 |
| ANSYS-CFX Bayraktar et al. (2012) | 6.1829 | 0.0094 | - |
| OpenFOAM Bayraktar et al. (2012) | 6.1893 | 0.0097 | - |
| FEATFLOW Becker \& Braack (2001) | 6.1847 | 0.0094 | - |
| LPS $\mathbb{P}_{1} \times \mathbb{P}_{1}$ | 6.0568 | 0.0088 | 0.1755 |
| LPS $\mathbb{P}_{1} \times \mathbb{P}_{0}$ | 5.9322 | 0.0084 | 0.1669 |

Table 1. The drag and lift coefficients, and the pressure obtained from different numerical methods.
Figures 13 and 14 show a zoom of the streamtraces and the isovalues of the magnitude of the velocity and of the pressure at the cross-section $z=0.205$. Here we used the finite elements $\mathbb{P}_{1} \times \mathbb{P}_{1}$ (continuos pressure) and $\mathbb{P}_{1} \times \mathbb{P}_{0}$. Observe that the overall results are in accordance with the expected behavior of the fluid flow (see Bayraktar et al. (2012), for instance).

Fig. 13. The streamtracers (top left) and the isovalues of the magnitude of the velocity field (top right), and the isovalues of the magnitude of the pressure (bottom left) and streamlines of the velocity at a horizontal cross-section (bottom right). Here we used the finite element $\mathbb{P}_{1} \times \mathbb{P}_{1}$.

FIG. 14. The streamtracers (top left) and the isovalues of the magnitude of the velocity field (top right), and the isovalues of the magnitude of the pressure (bottom left) and streamlines of the velocity at a horizontal cross-section (bottom right). Here we used the finite element $\mathbb{P}_{1} \times \mathbb{P}_{0}$.

## 6. Conclusions

We proposed a stabilized "term-by-term" finite element method for the fully non-linear incompressible Navier-Stokes equations. Driven by the solution of local Stokes problems, the stabilized terms (with their stabilization parameters) made the simplest element and the equal-order piecewise linear spaces inf-sup stable. From a practical standpoint, such an upscaling procedure has been performed analytically avoiding more involved two-level computations. As a result, it can be seen as a member of the LPS class of methods with no extra computational costs involved in the computation of the stabilized terms. Also, the method was proved to be optimal convergence despite of its lack of consistency. We conclude that the proposed LPS method is a competitive option to handle complex (eventually multiscale) flows, while remains a fair compromise between accuracy and computational cost as highlighted by the three-dimensional numerical validations.

## Funding

The first author was partially supported by CONICYT/Chile through FONDECYT project ${ }^{\circ}$ 1110551, Basal project CMM-CI2MA PFB-03, Anillo project ANANUM ACT1118 and Red Doctoral REDOC.CTA, MINEDUC project UCO1202 at U. de Concepcion. The second author was partially funded by CONICYT/Chile through FONDECYT project $\mathrm{N}^{\circ} 11130674$ and by project Inserción de Capital Humano Avanzado en la Academia $\mathrm{N}^{\circ} 79112028$. Finally, the third author was funded by CNPq/Brazil and CAPES/Brazil.
